## Preface

This is the 2006 edition of *Road Casualties Great Britain 2006: Annual Report* (RCGB) renamed from "Road Accidents Great Britain – The Casualty Report". It presents statistics, collected to an agreed national standard, about personal injury road accidents and their consequent casualties. Some 50 data items are collected for each accident, including the time and location of the accident, the types of vehicle involved, what they were doing at the time of the accident, as well as some information on the drivers and casualties involved. These statistics are used to inform public debate on matters of road safety and to provide both a local and national perspective for road safety problems and their remedies.

The first edition of this report covered road casualty numbers in 1951. At that time, there were 4.7 million vehicles in use, and the police recorded 178,000 personal injury road accidents. In 2006, the vehicle population stood at 33 million and there were 189,000 injury accidents. Thus, while the vehicle stock has increased sevenfold, the number of injury accidents has increased by about a fifth. Between 1951 and 2006, 309,144 people were killed and 17.6 million persons were injured in accidents on British roads. Most of the casualties were slightly injured, and the numbers of people killed and seriously injured each year have been reducing; however, this is still a serious problem. Against this background, in 2000 the government announced a new road safety strategy and casualty reduction targets for 2010 with particular emphasis on child casualties. This volume gives the baseline averages to be used in monitoring these new targets, and the first article in this edition reports progress to date.

The national road accident statistics are collected and published partly to inform public debate and partly to provide the basis for determining and monitoring effective road safety policies. The credible monitoring of targeted reductions requires that data be reported consistently and accurately. Local and national government, and local police forces, work closely to achieve a common reporting standard. A complex devolved reporting system such as that operated in Great Britain will never produce perfect results, but the high standards that are achieved reflect the efforts of local authorities and police forces to report to the standard national requirement. However, readers should note that, while very few, if any, fatal accidents do not become known to the police, there is evidence that an appreciable proportion of non-fatal injury accidents are not reported to the police and therefore are not included in this publication. In addition, research has shown that up to a fifth of casualties reported to the police are not included in the statistical return. Moreover, studies also show that the police tend to underestimate the severity of injury because of the difficulty in distinguishing severity at the scene of the accident. The Department is undertaking further research to investigate whether levels of reporting have changed. Further information on levels of reporting can be found on the Department's website at:

<http://www.dft.gov.uk/pgr/statistics/datatablespublications/accidents>

In addition to the STATS19 data, other data sources directly related to road safety have been used to compile this book. These include death registrations and coroners' reports, as well as traffic and vehicle registration data. More detail on traffic and vehicles can be obtained from the Department's annual publication *Transport Statistics Great Britain*.

Copies of the full RCGB report (in PDF format) and all tables (in Excel format) are available from the Department's website:

<http://www.dft.gov.uk/pgr/statistics/datatablespublications/accidents/casualtiesgbar>

#### Tables

##### Part I Trends: 1994-1998 average and 1999 to 2006 (unless stated)

###### General

1a	Vehicle population, traffic and road length: 1996 - 2006	90
1b	Road traffic by vehicle type and road class: 2005 - 2006 and 1994-98 average	91
2	Population, vehicle population, index of vehicle mileage, accidents and casualties: by road user type and severity: 1930 - 2006	92

### *Accidents*

3	Accidents and accident rates: by road class and severity	93
4	Accidents: by road class, speed limit and severity	94

### *Casualties*

5a	Male casualties: by built-up and non built-up roads, road class and severity	95
5b	Female casualties: by built-up and non built-up roads, road class and severity	96
5c	All casualties: by built-up and non built-up roads, road class and severity	97
6a	Male casualties: by road user type and severity	98
6b	Female casualties: by road user type and severity	99
6c	All casualties: by road user type and severity	100
7a	Male casualties: killed or seriously injured: by road user type and age	101
7b	Female casualties: killed or seriously injured: by road user type and age	102
7c	All casualties: killed or seriously injured: by road user type and age	103
8	Casualties: by time of accident and severity: 1996 - 2006	104
9	Casualty rates: by road user type and severity: 1996 - 2006	104

### *Vehicles and drivers involved*

10	Vehicles involved and involvement rates: by vehicle type and severity of accident: 1996 - 2006	105
11	Breath tests and breath test failures: by drivers and riders involved in accidents: 1996 - 2006	106

## **Part II Detailed tables 2006 (unless stated)**

### *General*

12	Accidents, vehicles and casualties: casualties by severity: by road class, built-up and non built-up roads	107
13	Accidents and casualties: by severity, road type and speed limit	108

### *Accidents*

14	Accidents: by severity, number of casualties involved, built-up and non built-up roads and road class	109
15a	Accidents: by daylight and darkness, road surface condition, built-up and non built-up roads and severity	110
15b	Casualties: by daylight and darkness, road surface condition, built-up and non built-up roads and severity	110
16a	Accidents: by daylight and darkness, weather condition, built-up and non built-up roads and severity	111
16b	Casualties: by daylight and darkness, weather condition, built-up and non built-up roads and severity	111
17	Accidents: by daylight and darkness, road surface condition, built-up and non built-up roads, speed limit and street lighting	112
18	Accidents: by daylight and darkness, lighting conditions, special conditions and carriageway hazards	113
19	Accidents: by junction type, built-up and non built-up roads and severity	113
20	Single vehicle accidents: by object hit off carriageway: built-up and non built-up roads and severity	114
21	Accidents: by number of vehicles involved, built-up and non built-up roads, road class and severity	115

### *Accidents (continued)*

22	Accidents involving pedestrians and one vehicle: by severity and vehicle type	116
23a	Accidents, vehicle user and pedestrian casualties in urban areas: by combination of vehicles involved	117
23b	Accidents, vehicle user and pedestrian casualties in rural areas: by combination of vehicles involved	118
23c	Accidents, vehicle user and pedestrian casualties in all areas: by combination of vehicles involved	119

### *Casualties*

24	Casualties: by built-up and non built-up roads and motorways, severity and road user type	120
25	Casualties in accidents involving vehicles of different types: by built-up and non built-up roads, road class and severity	121
26	Casualty and accident rates: by urban and rural roads, road class, road user type, severity and pedestrian involvement	122
27	Number of casualties: by accident and casualty severity and road user type	123
28	Casualties and casualty rates: by month, road user type and severity	124
29a	Casualties: by day, road user type and hour of day	125
29b	Casualties: killed or seriously injured: by day, road user type and hour of day	126
29c	Casualties: all days: by severity, road user type and hour of day	127
30a	Casualties: by age band, road user type and severity	128
30b	Casualties: by age band, road user type and severity: 1994-98 average	129
31	Casualty rates: by age band, road user type and severity	130
32	Pedestrian casualties: location by age band and by severity	131
33	Pedestrian casualties: by location, age, road crossing type and severity	132
34	Casualties: by age, road user type and severity	133
35	Casualties in cars: by severity, age, seating position, built-up and non built-up roads	134

### *Drivers and vehicles involved*

36	School pupil casualties on journeys to and from school: by road user type, severity, gender and age	135
37	Breath tests and breath test failures: all drivers and riders involved, by day of week and time of day	136
38a	Drivers: by gender, number injured, road user type and age	138
38b	Drivers: by gender, number injured, road user type and age: 1994 - 1998 average	139
39	Breath tests and breath test failures: by road user type and age	140
40	Vehicles: by accident severity, vehicle type and vehicle population	141
41a	Vehicles: by vehicle type, built-up and non built-up roads, road class and accident severity	142
41b	Vehicles: by vehicle type, built-up and non built-up roads, road class and accident severity: 1994-98 average	143
42	Vehicles involvement rates: by vehicle type, urban and rural roads, road class, accident severity and traffic	144
43	Vehicles: by junction type, vehicle type, built-up and non built-up roads	145
44	Vehicles skidding or overturning, and towing: by road surface condition, special conditions at site and vehicle type	146
45	Vehicles involved in accidents: by vehicle type and manoeuvre	147

### *Area comparisons*

46a	Casualties: by road user type, severity and local authority	148
46b	Casualties: by road user type, severity and local authority: 1994-98 average	152
47	Casualties: by Government Office region, country and severity: 1994-98 average, 1999 - 2006	156
48	Casualties: by built-up and non built-up roads, road class, Government Office region and severity	157

### *United Kingdom*

49	Casualties: by severity, road user type and country: United Kingdom	158
----	---	-----

### *Mortality*

50	Deaths: by age and gender, from all causes, all accidental deaths and all road deaths: 2005	159

# 1. Review of progress towards the 2010 casualty reduction targets

*Rashmeeta Singh and Linden Francis, Transport Statistics: Road Safety, Department for Transport*

## Summary

This article shows progress towards the Government's casualty reduction targets for Great Britain and reviews the main trends in road casualties in 2006 compared with recent years, based on information about accidents reported to the police.

In 2000, the Government published a safety strategy in *Tomorrow's Roads Safer for Everyone*. By 2010, the aim is to achieve, compared with the average for 1994–98:

- A 40% reduction in the number of people killed or seriously injured (KSI) in road accidents;
- A 50% reduction in the number of children killed or seriously injured (children are defined as being those aged under 16);
- A 10% reduction in the slight casualty rate, expressed as the number of people slightly injured per 100 million vehicle kilometres

Compared with the 1994–98 average baseline, in 2006

- The number of people killed or seriously injured was under 32 thousand, 33 per cent below the baseline (Table 1a).
- The number of children killed or seriously injured was 52 per cent below the baseline.
- The slight casualty rate was 28 per cent below the baseline.
- The number of people killed was 11 per cent below the 1994–98 baseline.
- The number of children killed was 35 per cent below the 1994–98 baseline.
- In this period the traffic has risen by an estimated 15 per cent.

## **Total killed or seriously injured casualties**

***(Target reduction 40 per cent from the 1994–98 average)***

Table 1a gives figures for casualties in accidents reported to the police and progress against targets. Charts 1a–1c show progress to date on the casualty reduction targets. Table 1b shows progress towards the overall KSI target for particular road user types. With the exception of motorcycle users, the percentage reductions from the 1994–98 average baseline fall in the range of 30–40 per cent. The number of motorcycle KSI user casualties is almost the same as in the baseline. Over this period, motorcycle traffic has increased by 33 per cent, and car traffic by 12 per cent.

**Table 1a: All casualties by severity and progress against 2010 targets: GB 2006**

	Number			2006: Percentage change over		1994-98 average
	1994-98 average	2004	2005	2006	2005

Car users	23,254	16,144	14,617	<b>14,254</b>	-2	<b>-39</b>
Bus/coach users	716	488	363	<b>426</b>	17	<b>-40</b>
Other road users	1,810	1,285	1,178	<b>1,188</b>	1	<b>-34</b>
All road users	47,656	34,351	32,155	<b>31,845</b>	-1	<b>-33</b>

**Chart 1a: Killed or seriously injured casualties: 1994-2006**

**Chart 1b: Killed or seriously injured child casualties: 1994-2006**

**Chart 1c: Rate of slightly injured casualties per 100 million vehicle kilometres: 1994-2006**

Chart 1d shows the proportion of KSI casualties by road user type. The most significant change is that the proportion of motorcycle casualties has increased from 14 to 20 per cent.

**Comparisons with 2005 and the 1994–98 baseline average by road user type**

- The number of pedestrian KSI casualties on Britain’s roads in 2006 fell by 1 per cent compared with 2005 to a level 40 per cent below the baseline.
- The number of pedal cyclist KSI casualties rose by 3 per cent compared to 2005, but is still 35 per cent below the baseline
- KSI casualties among motorcycle users are at the same level as 2005 and the baseline.

**Chart 1d: Proportion of killed or seriously injured casualties by road user type: baseline (1994–98 average) and 2006: GB**

Table 1c shows changes in KSI casualties for different road types. Since 2005, casualties have increased by 1 per cent on urban roads, but have decreased by 3 per cent on rural roads. Over this period, traffic on urban roads has increased by 0.3 per cent and on rural roads by 2 per cent.

**Comparisons with 2005 and the 1994–98 baseline average by road type**

- The number of KSI casualties on motorways in 2006 was 23 per cent below the baseline. These casualties also fell by 8 per cent compared with 2005.
- The number of KSI casualties on urban roads in 2006 has fallen 35 per cent since the baseline period.
- The number of KSI casualties on rural roads (excluding motorways) in 2006, had decreased by 31 per cent since the baseline.

**Table 1c: Killed or seriously injured casualties by road type: GB 2006**

	Number				2006: Percentage change over	
	1994-98 average	2004	2005	2006	2005	1994-98 average

**Chart 1e: Proportion of killed or seriously injured casualties by road type: baseline (1994–98 average) and 2006: GB**

**Children killed or seriously injured**

*(Target reduction 50 per cent from the 1994–98 average)*

Table 1d shows progress on child casualties by road user type, and Table 1e gives details by type, and age, and gender. Chart 1f shows child KSI casualties by type and gender.

**Comparison with 2005 and the 1994–98 baseline average for children:**

- The number of child pedestrian KSI casualties on Britain’s roads in 2006 fell by 5 per cent compared with 2005 and to a level 51 per cent below the baseline.
- The number of child pedal cyclist KSI casualties in 2006 also fell by 5 per cent compared with 2005, and decreased by 55 per cent since the baseline.
- The number of child car user KSI casualties in 2006 was 54 per cent below the baseline. There was no change compared with 2005.
- Almost 3 out of 5 child pedestrian KSI casualties in 2006 were male, with nearly six times as many male child pedal cyclists killed or seriously injured as females (Chart 1f)

**Table 1d: Children<sup>1</sup> killed or seriously injured casualties by road user type: GB 2006**

1 Rate per 100 million vehicle kilometres.

### Comparison with 2005 and the 1994–98 average, for slight casualties:

- The number of pedestrian slight casualties was 31 per cent below the baseline.
- The number of pedal cyclist slight casualties in 2006 was 33 per cent below the baseline. The rate of slight casualties among pedal cyclists was 41 per cent below the baseline.
- The number of slight casualties among motorcycle users has decreased by 4 per cent from the baseline, and 8 per cent from 2005. The slight casualty rate was 28 per cent below the baseline.
- The number of slight casualties among car users in 2006 was 13 per cent lower than the baseline, and the slight casualties rate was 22 per cent lower.
- Care should be exercised in comparing the rate of slight bus and coach user casualties with that for other road user groups. The rates given in Table 1g are per 100 million vehicle kilometres, and this type of vehicle has a much higher occupancy than other road vehicles. Comparisons of rates per billion passenger kilometres are given in Table 52 of the main tables.
- The slight casualty rate for motorways was 15 per cent lower than the baseline. The slight casualty rate for urban and rural roads was 27 and 25 per cent lower than the baseline respectively.

### Casualties by road user type

Table 1i shows casualties by gender and child casualties.

- In 2006, male casualties made up 58 per cent per cent of all casualties but 76 per cent of those killed.
- In 2006 the numbers of male and female casualties were 17 per cent and 22 per cent respectively lower than the 1994–98 baseline. Over the same period the number of men killed has fallen by only 6 per cent compared to 25 per cent for women.
- The number of child casualties fell by 9 per cent in 2006 compared to 2005. However, child fatalities increased by 20 per cent in 2006 compared to 2005. The total number of fatalities among children was 169, 28 more than 2005, but about the same level as 2004 (166) which at that time was the lowest ever recorded figure.

**Table 1i: All Casualties by severity: GB 2006**

1 Includes cases where gender not known

2 Casualties aged 0-15.

Chart 1h shows the distribution of 2006 casualties by road user type for men and women. Female casualties are twice as likely to be car passengers as men, but less likely to be injured as motorcycle or pedal cycle users.

**Chart 1h: All casualties by road user type and gender: GB 2006**

## Pedestrians

Table 1j shows pedestrian casualties in 2006 by age. Pedestrian casualties account for 12 per cent of all road casualties and 21 per cent of all road deaths. Total pedestrian casualties fell to 33 per cent below the baseline average in 2006, with serious casualties 40 per cent below the baseline. Reductions are more pronounced in some age groups than others. Child pedestrians aged up to fifteen were the only age group to show an increase in fatalities, compared with 2005 from 63 to 71 (13 per cent). However, the 2006 level remained below that for 2004. Children also saw the biggest fall for all casualties compared with 2005, a drop of 10 per cent. Child pedestrian casualties accounted for 33 per cent of all pedestrian casualties. Pedestrian deaths have increased by 1 per cent from 2005, but remain 33 per cent below the 1994–98 average baseline.

The rate of pedestrian casualties per 100,000 population has been falling and in 2006 was 36 per cent lower than the baseline. The annual average distance walked by pedestrians in 2006 was less than 1 per cent below the 1994–98 average. According to the National Travel Survey, the average distance walked by the individuals in 2006 was 201 miles. This was an increase of 2 per cent compared with the average distance walked in 2005 (197 miles).

**Table 1j: Pedestrian casualties by age: GB 2006**

## Pedal cyclists

Table 1k gives the number of reported pedal cyclist casualties in 2006. Pedal cyclist casualties have fallen by 34 per cent from the baseline. The number of pedal cyclist deaths in 2006 was 1 per cent lower than 2005 and 21 per cent lower than the 1994–98 average. However, since pedal cycle traffic has increased by 4 per cent since 2005, the casualty rate has decreased by more (6 per cent) since 2005, and is 42 per cent below the baseline.

**Table 1k: Pedal cyclist casualties: GB 2006**

	Number				2006: Percentage change over	
	1994-98 average	2004	2005	2006	2005	1994-98 average
Killed	186	134	148	<b>146</b>	-1	<b>-21</b>

1. 100 million vehicle kilometres.

2. Rate per 100 million vehicle kilometres.

## Motorcycle users

Motorcycle user casualties are shown in Table 11. Motorcycle users accounted for 9 per cent of all road traffic casualties but 19 per cent of all fatalities in 2006. Total motorcycle user casualties are 3 per cent below the baseline and 6 per cent lower than in 2005. In spite of motorcycle traffic decreasing by 5 per cent from 2005 to 2006, KSI figures were almost unchanged, leading to an increase in the KSI rate of 5 per cent. Fatalities increased by 5 per cent over this period. Since the 1994–98 average baseline motorcycle traffic has risen by 33 per cent, fatalities rose by 28 per cent over the same period, although serious casualties changed little, leading to a reduction of 25 per cent in the KSI rate.

**Table 11: Motorcycle user casualties: GB 2006**

	Number				2006: Percentage change over	
	1994-98 average	2004	2005	2006	2005	1994-98 average

1 100 million vehicle kilometres.

2 Rate per 100 million vehicle kilometres.

## Car users

Car user casualties, given in Table 1m, were 16 per cent lower in 2006 than the average for 1994–98. However, as car traffic has increased by 12 per cent since the baseline, the rate of all car user casualties per 100 million vehicle kilometres was 25 per cent lower than the 1994–98 average. Both car driver and passenger deaths in 2006 dropped by 4 per cent compared to 2005. However, compared to the 1994–98 average, car driver deaths have fallen more slowly than for passengers and were 5 per cent lower than baseline against 14 per cent below for car passengers. Total car driver and passenger casualties show a similar pattern, with drivers 10 per cent below the baseline in 2006 and car passenger casualties 26 per cent lower.

**Table 1m: Car user casualties: GB 2006**

## Bus and coach users

Table 1n shows casualties among bus and coach users in 2006. The number of bus and coach user casualties decreased by 8 per cent compared with 2005, and was 24 per cent lower in 2006 than the baseline average. The number of serious injuries was 42 per cent lower than the 1994–98 average. Care should be exercised in comparing the rate of slight bus and coach user casualties with the rates for other road user groups. The rates given in Table 1n are per 100 million vehicle kilometres, and this type of vehicle has a much higher occupancy than other road vehicles. Comparisons of rates per billion passenger kilometres are given in Table 52 in the main tables.

**Table 1n: Bus and Coach casualties: GB 2006**

1 100 million vehicle kilometres.

2 Rate per 100 million vehicle kilometres.

## Goods vehicle users

The number of light goods vehicle user casualties in 2006 was 20 per cent lower than the 1994–98 average. However, since light goods traffic has increased by 38 per cent over this period, the casualty rate has decreased much more, 42 per cent since the baseline. Deaths among light goods vehicle users have decreased by 20 per cent compared to the 1994–98 average and serious injuries by 46 per cent.

The number of heavy goods vehicle occupant casualties has decreased by 24 per cent compared with the average for 1994–98. However, over this period heavy goods vehicle traffic has increased by 11 per cent, resulting in a reduction of 32 per cent in the overall casualty rate for heavy goods vehicle occupants. Deaths among heavy goods vehicle users have decreased by 27 per cent and serious injuries by 35 per cent compared to the 1994–98 average.

**Table 1o: Goods vehicle user casualties: GB 2006**

## 2. A valuation of accident, casualty costs and insurance claims data

*Linden Francis, Transport Statistics: Road Safety, Department for Transport*

### Introduction

Since 1993, the valuation of both fatal and non-fatal casualties has been based on a consistent willingness to pay (WTP) approach. This approach encompasses all aspects of the valuation of casualties, including the human costs and the direct economic costs, i.e. an amount to reflect the pain, grief, suffering, lost output as well as the medical costs associated with road accident injuries.

An article in *Road Accidents Great Britain 1994* (Kate McMahon, Road Safety Division, Department for Transport) described the methodology for casualty cost valuation, and, in particular, the revised non-fatal casualty values. This article provides updated values for 2006 casualties and accidents, and describes the revisions to medical and accident costs.

Fuller information on accident costs will be published as usual in *Highways Economic Note No 1: Valuation* of the benefits of prevention of road accidents and casualties. More specific details are given at the end of this article.

### Casualties

The values for the prevention of fatal, serious and slight casualties include the following elements of cost:

- loss of output due to injury. This is calculated as the present value of the expected loss of earnings plus any non-wage payments (National Insurance contributions, etc.) paid by the employer.
- ambulance costs and the costs of hospital treatment.
- human costs, based on WTP values, which represent pain, grief and suffering to the casualty, relatives and friends, and, for fatal casualties, the intrinsic loss of enjoyment of life over and above the consumption of goods and services.

### Accidents

The average value of prevention per injury accident for each level of severity is higher than the average value per casualty, e.g. value of preventing a fatal accident is greater than the value of a fatality for two reasons. The first is that an injury accident is classified according to the most severe casualty but will on average involve more than one casualty – for example, in 2006 a fatal accident on average involved 1.10 fatalities, 0.34 serious casualties and 0.52 slight casualties. The second reason is that there are some costs which are part of the valuation of an injury accident but which are not specific to casualties. These are:

- costs of damage to vehicles and property
- costs of police and the administrative costs of accident insurance.

## Valuation of the benefits of prevention of accidents

Table 2a gives the average value of prevention per road accident and per casualty. The total cost-benefit value of prevention of road accidents in 2006 was estimated to be £18,079 million, of which 13,081 million is attributable to personal injury accidents, with damage-only accidents accounting for the remainder.

**Table 2a: Average value of prevention per casualty and per accident: GB 2006**

£		
Accident/casualty type	cost per casualty	cost per accident
Fatal	1,489,450	1,690,370
Serious	167,360	196,020
Slight	12,900	20,120
Average all Severities	48,170	69,150
Damage only	-	1,780

Table 2b gives the average value of prevention of injury accidents by different types of road. Seventy-one per cent of accidents occurred on built-up roads, but these accounted for only 56 per cent of the total value of injury accidents, because they were, on average, less severe than on other roads, having fewer casualties per accident and a lower proportion of fatal and serious injuries. Non built-up roads accounted for 24 per cent of accidents and 39 per cent of value, and 4 per cent of accidents with 5 per cent of value occurred on motorways. The lesser severity of accidents on built-up roads is shown in Table 2b, where the average value of prevention per accident on built-up roads is less than half the average value on non built-up roads.

**Table 2b: Average value of prevention of road accidents by road type: GB 2006**

£				
Accident type	Built-up Roads	Non built-up Roads	Motorways	All Roads
Fatal	1,625,440	1,729,690	1,800,580	1,690,370
Serious	186,900	213,450	217,040	196,020
Slight	18,970	22,430	26,600	20,120
All injury	54,020	111,540	79,260	69,150
Damage only	1,660	2,460	2,360	1,780

Transport Research Laboratory (TRL) reports are available from TRL Ltd, Wokingham, Berkshire (Tel: 01344 773131, e-mail: [enquiries@trl.co.uk](mailto:enquiries@trl.co.uk)). Information on accident numbers and rates (rather than costs) may be obtained from two annual DfT/The Stationery Office publications, *Road Casualties Great Britain*, and *Transport Statistics Great Britain*. These and the Highways Economic Note 1 (HEN1) are published annually on the DfT website at <http://www.dft.gov.uk> under 'Transport Statistics/Statistics/Transport accidents and casualties' and 'Road Safety/Economic Assessment' respectively.

Copies of HEN1 are available from DfT Free Literature; telephone 0870 122 6236. For further information, please contact Adam Bell by telephone on 020 7944 6177 or by e-mail on [adam.bell@dft.gsi.gov.uk](mailto:adam.bell@dft.gsi.gov.uk)

### **Motor insurance claims**

The data given in Table 2c are the latest available figures from insurance companies' DTI returns, the statutory returns which insurers are required to file with the Department of Trade and Industry. Only insurance companies are obliged to complete the returns, and so the data do not include business written by Lloyd's underwriters. The data have been provided by the Association of British Insurers from the SynTheys Non-Life database of returns.

Table 2c gives claim data for the period 2001–05. The figures are for all insurance claims and will include those arising from fire or theft as well as from road accidents. Exposure (expressed in million vehicle years) is the exposure to risk and the product of the number of vehicles insured and the proportion of the year for which each vehicle was covered. The claim frequency shows the proportion of policyholders that made a claim.

For further information see the Association of British Insurers website at [www.abi.org.uk](http://www.abi.org.uk).

1. 2005 data is not available.

### 3. Drinking and driving

*Penny Allen, Transport Statistics: Road Safety, Department for Transport*

#### Summary

This article examines the subject of drinking and driving. It first explains how drink-drive accidents and casualties are defined in these statistics. It then sets out the alcohol test limits that apply in the United Kingdom, followed by a description of the sources of data used to produce the drink-drive estimates, with a discussion of their reliability. The article concludes with an analysis of the characteristics of drink-drive accidents and casualties.

- In 2006, it was estimated that 14,350 casualties (6 per cent of all road casualties) occurred when someone was driving while over the legal limit for alcohol. The number of deaths was 540 (17 per cent of all road deaths).
- During the 1980s, the number of KSI (killed or seriously injured) casualties fell by nearly a half, from 9,420 in 1980 to 4,850 in 1990. There were some fluctuations from year to year from 1990 to 2002, but further more significant falls were evident in the last few years. The provisional 2006 KSI total of 2,530 is about a quarter of the 1980 level, and 4 per cent below the 2005 level.
- The number of people killed in drink-drive accidents fell to a low of 460 deaths in 1998, but has since risen, with an estimated 540 deaths in 2006.
- The numbers of slight injuries in drink-drive accidents have been showing a broadly rising trend since 1993 but again have fallen since 2002. Provisional figures for 2006 suggest a fall of 7 per cent since 2005.

#### Drink-drive limits and definitions

For the purposes of these drink-drive statistics, a drink-drive accident is defined as being an incident on a public road in which someone is killed or injured and where one or more of the motor vehicle drivers or riders involved *either* refused to give a breath test specimen when requested to do so by the police (other than when incapable of doing so for medical reasons), *or* one of the following:

- i) failed a roadside breath test by registering over 35 micrograms of alcohol per 100 millilitres of breath
- ii) died and was subsequently found to have more than 80 milligrams of alcohol per 100 millilitres of blood.

Drink-drive casualties are defined as all road users killed or injured in a drink-drive accident.

However, not all drink-drive accidents will be detected in this way, as there are some drivers involved for whom neither of the above test results are available, even though they were over the legal limit. Therefore the Department's statistics are adjusted to allow for this in order to produce a better estimate of the number of drink-drive accidents and casualties. The reasons for the unavailability of some data and the methods of adjustment are described in more detail later in this article.

## Blood and breath testing powers

Roadside breath tests were introduced in 1967, and the blood alcohol limit became a legal requirement at the same time. Evidential breath testing was introduced in 1983 to supplement the taking of blood samples. Section 6 of the Road Traffic Act (1988) allows the police to test any driver involved in an accident, whether or not anyone is injured. The act also stipulates that, where there has not been a road accident, the police can only take a roadside breath test following a moving traffic offence, or if there is suspicion of alcohol use. A high breath testing rate is acknowledged to have a deterrent effect upon potential drink-drivers, although research shows that a lower number of carefully targeted breath tests, which lessen the burden on police resources, can identify a large proportion of drink-drivers.

In April 1996 the Association of Chief Police Officers in England and Wales (ACPO) adopted a policy of breath testing all drivers involved in road accidents which the police deal with or attend, whether injuries are involved or not. Before this, all Scottish police forces, and some in England and Wales, already operated similar policies, but in some cases for injury accidents only. However, not all drivers involved in injury road accidents are breath-tested; either because the police do not attend the accident, or because a driver leaves the scene before a test can be taken, or because they are too seriously injured to take a test. Roadside breath testing rates after injury accidents can still vary widely among police forces.

## Data sources

Two sources of data are used to assess the extent and characteristics of drink-drive accidents in Great Britain and a third source provides information on compliance with drink-drive restrictions. These sources are:

- i) **Coroners' data:** Information about the level of alcohol in the blood of road accident fatalities aged 16 or over who die within 12 hours of a road accident is provided by coroners in England and Wales and by procurators fiscal in Scotland.
- ii) **STATS19 breath test data:** The personal injury road accident reporting system (STATS19) provides data on injury accidents in which the driver or rider survived and was also breath-tested at the roadside. If the driver or rider refused to provide a breath test specimen, then they are considered to have failed the test unless they are deemed unable to take the test for medical reasons.
- (iii) In addition, **police force screening breath test data:** Information from breath tests carried out at the roadside following a moving traffic offence, road accident or suspicion of alcohol use, is available for England and Wales from the Home Office.

Once the drink-drive accidents have been identified using coroners' and STATS19 data, then the resulting casualties in these accidents are identified from STATS19 data.

## Completeness of data and reliability of estimates

Both sources of data from the Police and Coroners on drink-drive accidents are incomplete. In recognition of the uncertainty associated with the estimates produced from this data the numbers of accidents and casualties are rounded to the nearest 10 throughout this article.

In the case of the STATS19 breath test data, some drivers and riders are not breath tested, since there are always occasions when it is not possible to administer a test to all drivers involved. Some drivers and riders not tested might have failed if a test could have been administered. Probably as a result of ACPO's policy the percentage of drivers tested increased dramatically between 1995 and 1999. Whereas prior to 1996 less than a third of drivers involved in injury accidents were tested, by 1998 this had risen to over half and remains at that level.

For many drivers or riders killed in road accidents, a post-mortem blood alcohol level is not available, either because the casualty died more than twelve hours after the accident, or because no test was carried out, or because some of the data are not reported to the Department by coroners and procurators fiscal.

Adjustments to the reported data are required to estimate the actual number of drink-drive accidents and their related casualties. The estimates published here are based on a method described by Derek Jones in the 1989 edition of *Road Accidents Great Britain* (RAGB). This method has two parts:

- a) the number of fatal accidents where a driver or rider died with an illegal alcohol level is estimated from the coroners' and procurators' fiscal data.
- b) the number of accidents where a surviving driver or rider had an illegal alcohol level is estimated from data, based on a calculation of the proportion of these alcohol-related accidents which can be identified from the STATS19 breath test data.

Part b) was revised in 1993 in the light of research by Dr J Broughton of the Transport Research Laboratory (TRL), published in TRL Report PR40 *The Actual Number of Non-Fatal Drink-Drive Accidents*. This provided a method which takes into account the fact that relatively more of the drivers and riders involved in fatal and serious accidents are breath-tested than in slight accidents, whereas previously a single factor had been used to allow for under-reporting for all accident severities. The revised estimates were first published in *RAGB 1992*.

Estimates for 2006 are provisional. As coroners' data are available for analysis a year later than the main road accident data, final estimates can only be made eighteen months in arrears. Around 58 per cent expected to be available ultimately were available for inclusion in the provisional estimates. The provisional estimates for serious and slight accidents depend on breath test data and do not change in the final estimates. The coroners' data affect only the numbers of casualties from fatal accidents and these form a small proportion of serious and slight casualties. The estimates for fatalities depend mainly on coroners' data and are particularly susceptible to revision between the provisional and final figures.

## **Analysis of drink-drive data**

Table 3a draws on both STATS19 and coroners' data to show estimates of the number of people killed and injured in drink-drive accidents. Chart 3a shows the trend of killed and seriously injured casualties resulting from drink-drive accidents.

**Table 3a: Estimates of accidents involving illegal alcohol levels and the consequent casualties adjusted for under reporting: GB 1980 - 2006**

Year	Accidents				Casualties			
	Fatal	Serious	Slight	Total	Fatal	Serious	Slight	Total
	1980	1,280	5,430	11,860	18,570	1,450	7,970	20,420
1985	900	4,900	11,460	17,260	1,040	6,810	19,380	27,220
1990	650	2,910	9,650	13,210	760	4,090	15,550	20,400
1995	460	2,140	7,590	10,180	540	3,000	12,450	16,000
1996	480	2,150	8,240	10,870	580	3,010	13,450	17,040
1997	470	2,140	8,100	10,710	550	2,940	13,310	16,800
1998	410	1,860	7,840	10,100	460	2,520	12,610	15,580
1999	400	1,850	8,800	11,050	460	2,470	13,980	16,910
2000	450	1,950	9,410	11,800	530	2,540	14,990	18,060
2001	470	2,020	9,780	12,270	530	2,700	15,550	18,780
2002	480	2,050	10,620	13,150	550	2,790	16,760	20,100
2003	500	1,970	9,930	12,400	580	2,590	15,820	18,990
2004	520	1,790	8,900	11,210	580	2,340	14,060	16,980
2005	470	1,540	8,060	10,070	550	2,090	12,760	15,400
2006 <sup>P</sup>	480	1,480	7,430	9,390	540	1,960	11,880	14,380

<sup>P</sup> Provisional data. The sample of fatality data from Coroners for 2005 has now been finalised but 2006 estimates are based on a reduced sample of coroners' returns and may be biased. They remain provisional until more complete information for 2006 is available.

**Chart 3a: Killed and serious casualties resulting from accidents involving illegal alcohol levels: GB 1979 – 2006**

<sup>P</sup> Provisional data

1) *Coroners' data*: Table 3b, based on coroners' and procurators' fiscal data, shows for all drivers and riders the percentage killed who were over the legal blood alcohol limit, analysed by age group, for the period 1991 to 2006. The proportion has fallen considerably since the early 1980s, when around a third of drivers and riders killed were over the limit. It has since remained at about one in five (dipping to one in six between 1997 and 1999).

Table 3b shows that provisional figures for 2006 indicate a fall in the percentage of car and other motor vehicle driver fatalities who were over the limit for all age groups, except those over forty. Motorcycle riders showed a little change in 16–29-year-olds, although the provisional figures are based upon a very small sample size.

**Table 3b: Drivers and riders killed: Percentage over the legal blood alcohol limit: GB 1991 - 2006**

Year	Motorcycle riders					Cars and other motor vehicles					All
	Age 16-19	Age 20-29	Age 30-39	Age 40+	All Ages	Age 16-19	Age 20-29	Age 30-39	Age 40+	All Ages	
1991	13	16	25	12	17	11	29	24	13	20	19
1992	10	30	34	20	26	13	26	18	10	17	20
1993	16	16	17	10	15	20	28	26	10	20	19

<sup>P</sup> Provisional data. The sample size for 2006 is not yet sufficient to give a full age breakdown.

<sup>1</sup> Age groups 16-29

<sup>2</sup> Age groups 30+

2) *STATS19 breath test data*: Table 3c shows the number of motor vehicle drivers and riders involved in injury accidents each year from 1997 to 2006, the number who were consequently required to take a roadside breath test and the number who failed the test either by registering a positive reading or by refusing to take the test. The proportion of drivers and riders failing breath tests fell between 1994 and 1999, reflecting the fact that the lower number of tests carried out in earlier years was obviously targeted at those drivers believed to have been drinking. Subsequently, it rose again until 2003, since when there has been a small drop. Testing rates had remained at about 50 per cent, rising slightly in 2006 to 54 per cent. The percentage of all drivers and riders involved in injury accidents who are required to take a breath test and subsequently fail has remained at close to 2 per cent throughout the past ten years.

**Table 3c: Drivers and riders in injury road accidents: breath tests and failures: GB 1997 - 2006**

	Number/Percentage									
	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006

3) *Police-force screening breath test data*: Table 3d shows the total number of drivers and riders required to take a roadside screening breath test in England and Wales. The numbers of screening breath tests carried out increased dramatically in the mid-1990s but have reduced again in recent years. Failure rates remained fairly stable during the late 1990s, but the number of failures has risen each year since 2000, despite a continuing decrease in the number of tests. The year 2004 showed an increase in the number of tests, along with a decrease in failures. The number of convictions fell between 1997 and 2001 but has risen again since then.

## Characteristics of drink-drive accidents

Drinking and driving is a year-round problem, as shown by the figures in Chart 3b. Although the pattern varies year on year, the first few months of the year generally have lower numbers of drink-drive accidents and casualties than other months of the year. However, there seem to be peaks in both the number of accidents and casualties in the months of May and October.

**Chart 3b: Estimated number of personal injury road accidents and casualties resulting where one or more driver or rider was over the legal alcohol limit by month: GB: 2005**

Table 3e, based on breath-test data, shows the percentage of car drivers involved in personal injury accidents who failed a breath test in 2006, analysed by age and sex of driver. It shows that male drivers under thirty had the highest incidence of failing a breath test after being involved in a personal injury road accident. The failure rate for women was only about a third of that for male drivers, a difference that cannot be accounted for by the slightly lower rates of testing for female drivers.

**Table 3e: Car drivers in injury road accidents: breath tests and failures: GB 2006**

Table 3f also shows that those aged under thirty have the most drink-drive accidents. However, the table goes on to analyse the data using information on the number of full or provisional licence holders and the annual average car mileage of these drivers. These data are taken from the *National Travel Survey (NTS) 2005*.

**Table 3f: Car drivers in road injury accidents: Accidents per license holder and per mile driven: GB 2005**

	Car driver drink-drive accidents	Drink-drive accidents per 100 thousand licence holders	Number
			Drink-drive accidents per 100 million miles driven

<sup>1</sup> Includes age not known.

<sup>2</sup> Figures based on a small NTS sample.

## Characteristics of drink-drive casualties

Table 3e showed that women are much less likely to be involved in drink-drive accidents as drivers than men. However, Table 3g shows that nearly a third of the total casualties in drink-drive accidents were women. It is estimated that there were around 660 casualties in drink-drive accidents who were pedestrians or cyclists.

**Table 3g: Estimated number of casualties in road accidents where at least one of the drivers or riders involved was over the legal limit: GB 2005**

	Number									
<u>Killed or seriously injured casualties</u>										
	Pedestrians	Cyclists	Motor-cyclists	Car drivers		Car passenger	Other	Male	Female	Total <sup>1</sup>

<sup>1</sup> Includes gender not recorded.

<sup>2</sup> Includes age not recorded.

Table 3h is based on 2005 coroners' and procurators' fiscal data using a sample which accounts for around 60 per cent of all road accident fatalities in that year. For these fatalities the table shows the percentages exceeding varying levels of blood alcohol for different classes of road user and the different proportions of fatalities exceeding 80 mg/100 ml by time of day. The pedestrian, passenger and cyclist fatalities shown in the table were not necessarily involved in drink-drive accidents, as defined earlier in this article, which involve a motor vehicle driver or rider who was over the limit.

Approximately one in four drivers killed, excluding motorcycles, were over the legal limit for driving a motor vehicle, which is 80 mg/100 ml of blood alcohol. The rate for motorcycle riders killed was about half of this. Around half of the drivers killed between 10 pm and 4 am were over the limit. Seventy-two per cent of pedestrians killed between 10 pm and 4 am were over the legal limit. However, blood alcohol levels were available for 77 per cent of motorcycle riders but for only 45 per cent of all pedestrian fatalities. The figures may therefore overestimate the proportion of fatalities which are over the legal limit.

**Table 3h: Blood alcohol levels of fatalities aged 16 and over: GB: 2005**

	Percentage over blood alcohol levels (mg/100ml)						Sample size	Percentage	
								Percentage over 80mg/100ml time of accident	
	9	50	80	100	150	200		22:00-03:59	04:00-21:59

## 4. Contributory factors to road accidents

David Robinson and Rashmeeta Singh, *Transport Statistics: Road Safety, Department for Transport*

### Summary

This article describes the scope and limitations of the information on contributory factors recently added to the national road accident reporting system and presents results from the second year of collection, including:

- *Failed to look properly* was the most frequently reported contributory factor and was reported in 35 per cent of all accidents. Four of the six most frequently reported contributory factors involved driver or rider error or reaction. For fatal accidents the most frequently reported contributory factor was *loss of control*, which was involved in 35 per cent of fatal accidents.
- Pedal cyclists, followed by LGV drivers are the most likely to be in an accident in which they *failed to look properly*, (25 per cent and 23 per cent respectively). Motorcycles are most likely to be in an accident with another vehicle that *failed to look properly*. Drivers or riders between 40 and 49 are the least likely to *fail to look properly* (17 per cent), but above this age the factor increases with driver/rider age.
- In 16 per cent of accidents involving injured or killed pedestrians, the pedestrian casualty had *Pedestrian masked when crossing* as a contributory factor.

### Introduction

In 2005 a new question on the factors which contributed to injury accidents was introduced to the national road accident reporting system. The system has always contained a great deal of information about the circumstances of the accident, the vehicles involved and their manoeuvres and the consequent casualties. However, it primarily answers questions about the 'where', 'when' and 'who' of an accident. The contributory factors system has been developed to provide some insight into the 'why' and 'how' they occur. They are designed to give the key actions and failures that led directly to the actual impact to aid investigation of how accidents might be prevented. The contributory factors are largely subjective reflecting the opinion of the reporting police officer and are not necessarily the result of extensive investigation. Some factors are less likely to be recorded since evidence may not be available after the event. While this information will be valuable in helping to identify ways of improving safety, care should be taken in its interpretation.

Part 1 of this article presents general analysis from accidents in 2006 and explains the scope of the system, along with the limitations of its use. However, much of the value of this new data is in assessing what happens in particular types of accident. Part 2 looks at the most commonly reported contributory factor in both 2005 and 2006 – *Driver/rider failed to look properly*.

## Part 1 – Contributory factor system and general analysis

### Contributory factor data

The STATS19 national system of collection of information on road accidents involving human injury gives considerable information about the circumstances of the accident including who the victims are, what types of vehicle are involved and what they are doing at the time of the accident and the general conditions at the time. However, until 2005 it did not routinely include information on the main reasons why road accidents happen.

Between 1999 and 2004 data on contributory factors were collected on a trial basis by 15 police forces. Some concerns were expressed about this trial system, for example some common types of accidents were difficult to describe. As a result of the consultation for the 2002-03 Quality Review of the Collection of Road Accident Statistics, a revised specification for the inclusion of contributory factor data in STATS19 was introduced. From 2005<sup>1</sup> all police forces in Great Britain began reporting contributory factors as an integral part of the STATS19 collection system.

It is important to note that whilst in some cases the contributory factor data collected since 2005 is similar to that collected during the trial, it is not possible to undertake a direct comparison of the results.

The contributory factors in a road accident are the key actions and failures that led directly to the actual impact. They show why the accident occurred and give clues about how it may have been prevented. The contributory factors are largely subjective and depend on the skill and experience of the investigating officer to reconstruct the events which led directly to the accident. The contributory factors reflect the reporting officer's opinion at the time of reporting and are not necessarily the result of extensive investigation. Furthermore, it is recognised that subsequent enquiries could lead to the reporting officer changing his opinion. The contributory factors are therefore different in nature from the remainder of the STATS19 data which is based on the reporting of factual information. This should be kept in mind when interpreting the data.

The contributory factor system allows the recording of up to six factors in those accidents reported at scene by the police. Multiple factors may be recorded against an individual participant in the accident (a driver/rider, a pedestrian casualty, a passenger casualty or an uninjured pedestrian), or an individual vehicle (for vehicle defects). Where the road environment was a contributory factor to the accident this can be recorded against any of the participants. Any given factor may be assigned to a number of participants. Both accidents and vehicles can have more than one contributory factor attributed to them, therefore percentages in this article will not necessarily add up to 100. On average 2.4 contributory factors per accident are reported.

The form used by the police to report contributory factors can be found towards the rear of this publication (see contents page). The form includes the full list of all 77 contributory factors used by the police.

It is important to note that where some factors may have contributed to the cause of an accident it may be difficult for a police officer attending the scene after the accident has occurred to identify these factors. As a result some contributory factors may be less likely to be reported. For instance, while factors such as *emergency vehicle on a call* or *defective traffic signals* may be more obvious for a police officer attending the scene and so may be reported with some confidence, for other factors, such as *exceeding speed limit* or *driver nervous, uncertain or panicked*, it may not always be possible for the police officer to identify whether these factors took place and contributed to the accident. In addition, contributory factors are disclosable in court and police officers would require some supporting evidence before reporting certain factors.

---

<sup>1</sup> The article based on the first year of contributory factor data can be found on the DfT website at the following web address - <http://www.dft.gov.uk/162259/162469/221412/221549/227755/contributoryfactorstoroadacc1802>

For each of the contributory factors given in an accident the police officer will indicate whether the factor is 'very likely' or 'possible', although in this article no distinction is made between these two categories.

**A contributory factor example:**

"A car driver is travelling at 40 miles per hour along a residential road with street lights late in the evening whilst talking on a mobile phone. The driver hits a child playing in the road wearing dark clothes".

Both participants in this accident had at least one contributory factor in this accident. The police officer may have coded the accident up as follows:

<b>Contributory factor</b>	<b>Which participant?</b>	<b>Confidence?</b>
Driver using mobile phone	Driver	Possible
Exceeding speed limit	Driver	Possible
Dangerous action in carriageway	Casualty	Very likely
Pedestrian wearing dark clothing at night	Casualty	Very likely

Additionally both participants in this example could also have been attributed *failed to look properly* (or in the case of the child *pedestrian failed to look properly*) as a factor. This is consistent with the data in the tables below which show *failed to look properly* as the most frequently reported contributory factor.

If the police officer had no evidence that the driver of the vehicle that hit the child was exceeding the speed limit (skid marks for instance) he may only suspect that this was the case and so code the factor only as 'possible'. The police officer may also have to rely on information from one of the participants to identify whether or not the driver was using a mobile phone.

As the data are still relatively new they may contain a some reporting errors. For instance, *going too fast for the conditions* should always be attributed to the driver (even if they are also a casualty). However in a small number of cases it has been attributed to a non driver casualty. There are fewer of these errors in 2006 compared to 2005. For future years it may be possible to introduce further validation checks to reduce these errors.

For accidents in which a police officer did not attend the scene it may not be possible for the reporting officer to accurately report the correct contributory factors. As a result, the analysis shown here only includes accidents in which a police officer attended the scene. In 2006, 81 per cent of accidents met this condition.

From 1 January 2005 contributory factors should be reported for all accidents where a police officer attended the scene. In the second year in which the new system was used there was an increase in the proportion of these accidents that had contributory factors reported, from 92 per cent in 2005 to 95 per cent in 2006. Accidents which were not reported at scene, or had no contributory factors are excluded from this analysis.

Table 4a shows the proportion of accidents and vehicles that satisfied both of the above conditions, shown for different accident severities, road types and vehicle types.

- In 2006, 77 per cent of all accidents satisfied both conditions and these accidents are the basis for the analysis in this article, this compares to 74 per cent in 2005.
- 92 per cent of fatal accidents satisfied these conditions, compared with 75 per cent of slight accidents.

- 89 per cent of accidents occurring on motorways satisfied these conditions, compared with 79 per cent and 78 per cent for A roads and B roads respectively.
- Over 83 per cent of Heavy Goods Vehicles and motorcycles involved in accidents in 2006 are included in this analysis. This compares with less than 65 per cent of pedal cycles and buses or coaches.

**Table 4a: Accidents and vehicles included in analysis<sup>1</sup>: GB 2006**

Category	Number included in analysis <sup>1</sup>	Total number in 2006	Per cent included in analysis <sup>1</sup>
<b>Accidents</b>

Other vehicles	2,316	3,072	75
<b>Vehicles included in analysis<sup>3</sup></b>	<b>269,312</b>	<b>348,059</b>	<b>77</b>

1 Includes accidents and vehicles involved in accidents where a police officer attended the scene and in which a contributory factor was reported.

2 Other roads includes C roads and unclassified roads.

3 Includes other vehicles types and cases where the vehicle type was not reported.

## 2006 results

Each of the 77 contributory factors fits into one of nine categories. Chart 4a shows the percentage of accidents in each category.

- The contributory factor category *driver/rider error or reaction* was the most frequently reported category, involved in 67 per cent of all accidents. It was also the most frequently reported type for each severity of accident.
- *Injudicious action* (including *going too fast for conditions*, *following too close* and *exceeding speed limit*) was the second most frequently reported category, involved in 27 per cent of all accidents. However this increases to 34 per cent of fatal accidents.
- Special codes (including *stolen vehicle*, *vehicle in course of crime* and *emergency vehicle on a call*) were reported for 5 per cent of all accidents.
- Pedestrian contributory factors, which are those where the factor has been attributed to an injured or uninjured pedestrian involved in the accident, were reported in 13 per cent of all accidents and 18 per cent of fatal accidents.

**Chart 4a: Contributory Factor type: accidents by severity: GB 2006**

Table 4b shows the percentage of accidents in which each contributory factor was reported, including a breakdown into accident severity.

- *Failed to look properly* was the most frequently reported contributory factor and was involved in 35 per cent of all accidents. This was followed by *failed to judge other person's path/speed* and *careless, reckless or in a hurry* (both 18 per cent). *Failed to look properly* was the most frequently reported contributory factor for slight and serious accidents (36 per cent and 28 per cent).
- For fatal accidents the most frequently reported contributory factor was *loss of control*, which was involved in 35 per cent of fatal accidents. *Loss of control* was also the second largest contributory factor for serious accidents (20 per cent).
- Four of the six most frequently reported contributory factors were some kind of *driver/rider error or reaction*, which includes *failed to look properly* and *failed to judge other person's path or speed*.

1 Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

2 Columns may not add up to 100 per cent as accidents can have more than 1 contributory factor. 0 indicates zero or negligible values

Table 4c compares the 10 most frequently reported contributory factors in 2005 and 2006. The ten factors remained the same in both years; however there were some small changes in the order and frequency of the factors. The largest change was an increase in the most frequently reported factor, *failed to look properly*, which was reported in 32 per cent of accidents in 2005 and 35 per cent in 2006. At this stage it is not possible to tell whether this change is the result of the reporting police officers developing their understanding of the new system or a genuine change in the kinds of factors that contribute to accidents.

**Table 4c: Contributory factors: GB 2005/2006 comparison**

Contributory factor reported in accident	2005		2006	
	Number	Percentage	Number	Percentage
Failed to look properly	46,516	32	50,354	35
Failed to judge other person's path or speed	26,245	18	26,946	18
Careless, reckless or in a hurry	23,744	16	25,668	18
Poor turn or manoeuvre	22,052	15	20,610	14
Loss of control	21,204	14	21,426	15
Travelling too fast for conditions	17,107	12	16,080	11
Slippery road (due to weather)	14,268	10	13,623	9
Pedestrian failed to look properly	13,690	9	13,879	10
Following too close	10,847	7	10,024	7
Sudden braking	10,273	7	10,354	7
Total number of accidents	147,509	100	145,798	100

1 Includes only accidents where a police officer attended the scene and in which a contributory factor was reported

2 Includes only the ten most frequently reported contributory factors

Table 4d shows, for each vehicle type, the percentage of **vehicles** which had each contributory factor. The table shows the ten most frequently reported contributory factors for each vehicle type.

The percentages in this table are different from those in Table 4b which gives the percentage of **accidents** with each contributory factor. For example when looking at *Failed to look properly* – 52,378 vehicles had this contributory factor out of a total of 269,312 vehicles (19 per cent of vehicles). The vehicles which had this contributory factor were in 50,354 accidents out of a total of 145,798 accidents (35 per cent of accidents). Part of the reason for the lower number when looking at the percentage of vehicles is that 116,133 vehicles (43 per cent) involved in accidents had no contributory factor reported.

- *Failed to look properly* was the most frequently reported contributory factor for every vehicle type. More information on this factor can be found in the second part of this article.
- Motorcycles had a notably higher percentage of the contributory factors *learner/inexperienced driver* (9 per cent) and *loss of control* (14 per cent) when compared to other vehicle types.
- *Sudden braking* was the second most frequently reported contributory factor for buses or coaches (13 per cent). 3 per cent of buses or coaches had *passing too close to cyclist* as a contributory factor. This was higher than any other vehicle type.
- *Cyclist entering road from pavement* was attributed to 11 per cent of pedal cycles in accidents and *cyclist wearing dark clothes* at night was attributed to 3 per cent.
- 6 per cent of Heavy Goods Vehicles (HGVs) involved in accidents had *vehicle blind spot* as a contributory factor.
- *Exceeding speed limit* was attributed to 3 per cent of cars involved in accidents, while *travelling too fast for conditions* was attributed to 6 per cent. For fatal accidents these figures are 10 per cent and 13 per cent respectively.

**Table 4d: Contributory factors: vehicles<sup>1</sup> by vehicle type: GB 2006**

Number of vehicles	12,296	100	9,720	100	269,312	100

<sup>1</sup>Includes only vehicles in road accidents where a police officer attended the scene and in which a contributory factor was reported. Columns may not add up to 100 per cent as accidents can have more than one contributory factor.

<sup>2</sup>Includes other vehicle types and cases where the vehicle type was not reported.

<sup>3</sup>0 indicates zero or negligible values – most are between 0.1%-0.5%

<sup>4</sup>Includes only the ten most frequently reported contributory factors for each vehicle

Table 4e shows contributory factors allocated to pedestrians. The table shows the ten most frequently reported contributory factors for both the percentage of accidents involving pedestrian casualties and the percentage of accidents involving uninjured pedestrians.

- *Pedestrian failed to look properly* was the most frequently reported contributory factor in both accidents involving injured or killed pedestrians and accidents involving uninjured pedestrians.
- In 16 per cent of accidents involving injured or killed pedestrians, the pedestrian casualty had *Pedestrian masked when crossing* as a contributory factor. The equivalent figure for uninjured pedestrians is 6 per cent.

**Table 4e: Contributory factors: Pedestrians<sup>1</sup>: GB 2006**

Contributory factor attributed to pedestrian <sup>3</sup>	Accidents involving injured or killed pedestrian <sup>4</sup>		Accidents involving uninjured pedestrian <sup>4</sup>	
	Number	Per cent <sup>2</sup>	Number	Per cent <sup>2</sup>
Pedestrian failed to look properly	12,711	57	85	31
Pedestrian careless, reckless or in a hurry	5,878	26	72	26

Number of accidents	22,353	100	273	100

1 Includes only pedestrians in road accidents where a police officer attended the scene and in which a contributory factor was reported. Columns may not add up to 100 per cent as accidents can have more than one contributory factor

2 0 indicates Zero or negligible value - most are between 0.1% and 0.5%

3 Includes only the ten most frequently reported contributory factors for both accidents involving injured or killed pedestrians and accidents involving uninjured pedestrians

4 Accidents can involve both pedestrian casualties and uninjured pedestrians

Table 4f shows contributory factors by road class. The table shows the ten most frequently reported contributory factors for each road type.

- *Failed to look properly* was the most frequently reported contributory factor for every road class. 37 per cent of accidents on A roads had this factor compared with 26 per cent on motorways.
- *Following too close* was a contributory factor in 16 per cent of accidents on motorways compared with 9 per cent for A roads and 5 per cent for B roads. Similarly, motorways also had the highest percentage of accidents which involved either *sudden braking* or *swerved* as contributory factors when compared to other road types.
- B roads had slippery road as a contributory factor in 12 per cent of accidents compared with 8 per cent for motorways and 9 per cent for A roads.

**Table 4f: Contributory factors: Accidents<sup>1</sup> by road type: GB 2006**

Contributory factor reported in accident <sup>4</sup>	Motorways		A roads		B roads		Other roads <sup>2</sup>		All roads

<sup>1</sup>Includes only accidents where a police officer attended the scene and in which a contributory factor was reported. Columns may not add up to 100 per cent as accidents can have more than 1 contributory factor.

<sup>2</sup>Other roads includes C roads and unclassified roads.

<sup>3</sup>0 indicates zero or negligible values – most are between 0.1% - 0.5%

<sup>4</sup>Includes only the ten most frequently reported contributory factors for each road type

The tables above give an overview of the contributory factors involved in all accidents. However, contributory factors can be most useful when looking at a particular subsection of accidents, for example, accidents involving young drivers or child pedestrians. In these more specific circumstances the use of contributory factors can be an important analysis tool to give insight into the possible causes of different types of accidents, and may help to develop policies to reduce road casualties.

Part 2 of this article gives an example of the more detailed analysis using contributory factor data.

## Part 2 – Accidents involving *failed to look properly* as a contributory factor

The first two years of contributory factor data has shown that *failed to look properly* is the most commonly reported contributory factor to road accidents. In 2006 it was allocated to 19 per cent of all vehicles in accidents and these accidents accounted for 35 per cent of all accidents.

The definition of *failed to look properly* is:

“A driver/rider either failed to look where they were going or they looked, but misinterpreted what they saw (looked but did not see). May be used where driver/rider was not paying attention to the road ahead.”

It is clear that this definition is quite broad and may encompass a large range of accident circumstances. The purpose of this part of the article is to investigate the kinds of accidents and drivers/riders which have *failed to look properly* as a contributory factor (also referred to as “the factor”). It is possible *failed to look properly* may sometimes be used as an excuse for their behaviour by drivers at fault, or as a default option by police officers in the absence of alternative evidence. There was a similar issue with the contributory factor *looked but failed to see* from the pilot contributory factor system. A review of this factor was published in 2005<sup>2</sup>.

Theoretically the factor should only be allocated to drivers or riders. However there are a small number of accidents in which the factor was attributed to participants who were not reported as drivers/riders. These accidents account for less than one per cent of all accidents involving failed to look properly and are included in the following analysis. There is a separate *failed to look properly* factor specifically allocated to pedestrians which is not included in the following analysis.

Table 4b in the first part of the article shows the factor is much more prevalent in accidents with a lower severity. It was reported in 19 per cent of fatal accidents, 28 per cent of serious accidents and 36 per cent of slight accidents. Therefore, slight accidents are almost twice as likely to involve the factor as fatal accidents.

**Table 4g: Accidents with "failed to look properly" as a contributory factor, by road type: GB 2006**

Road type	Percentage of accidents with factor			
	Fatal	Serious	Slight	All accidents
Motorways	9	21	26	<b>26</b>
Urban A roads	20	36	45	<b>43</b>
Urban other roads <sup>1</sup>	24	31	40	<b>38</b>
All urban roads <sup>1,2</sup>	22	33	42	<b>41</b>
Rural A roads	20	26	30	<b>29</b>
Rural other roads <sup>1</sup>	15	20	24	<b>23</b>
All rural roads <sup>1,2</sup>	18	23	28	<b>27</b>
<b>All roads<sup>2</sup></b>	<b>19</b>	<b>28</b>	<b>36</b>	<b>35</b>

1 Excludes motorways

2 Includes cases where road class was not reported

<sup>2</sup> Review of the 'Looked but Failed to See' Accident Causation Factor – Road Safety Research Report No. 60

Table 4g shows that *failed to look properly* occurs more in urban accidents than rural accidents. This may be because there is more going on in urban environments for the driver to fail to see or to be distracted by. Drivers also *fail to look properly* more on A roads than motorways or more minor roads.

**Table 4h: Accidents with "failed to look properly" as a contributory factor, by junction location: GB 2006**

Junction type	Number of accidents at junction type	Number of accidents with factor	Percentage of accidents with factor
Private drive/entrance	5,228	2,835	54
Mini-roundabout	1,162	570	49
Crossroads	13,947	6,787	49
T or staggered junction	43,355	19,433	45
Roundabout	10,606	4,554	43
Multiple junction	2,061	835	41
Other junction	4,850	1,742	36
Slip road	2,489	820	33
<b>All junctions</b>	<b>83,698</b>	<b>37,576</b>	<b>45</b>
<b>Not at within 20 metres of a junction</b>	<b>62,100</b>	<b>12,778</b>	<b>21</b>
<b>All accidents</b>	<b>145,798</b>	<b>50,354</b>	<b>35</b>

Three-quarters of *failed to look properly* accidents happen at or near a junction; accidents occurring at T or staggered junctions have the most *failed to look properly* accidents, 19,433 accidents in 2006 (table 4h). However, accidents occurring at private drives or entrances were the most likely to involve a participant *failing to look properly* as over half of all these accidents involved the factor. There is little difference between crossroads and mini-roundabouts in the proportion of accidents that involved the factor

Almost 60 per cent of drivers that were performing U turns at the time of the accident *failed to look properly* (table 4i). This was followed by over 50 per cent of the 26,400 drivers who were turning right. Although the proportion of vehicles going ahead that *failed to look properly* was relatively low (15 per cent), going ahead was the most common manoeuvre of vehicles that *failed to look properly* (38 per cent of these vehicles). This is because of the very large proportion of vehicles in accidents were going ahead at the time of the accident. Overall drivers or riders were more likely to *fail to look properly* if they were either turning or changing lane to the right compared to turning or changing lane to the left. This is especially true for car drivers and motorcycle riders..

**Table 4i: Vehicles with "failed to look properly" as a contributory factor, by vehicle manoeuvre: GB 2006**

Manoeuvre	Number of vehicles in accidents	Number of vehicles with factor	Percentage of vehicles with factor
U turn	2,126	1,251	59
Turning right	26,399	13,795	52
Reversing	2,649	1,369	52
Changing lane to right	3,085	1,560	51
Changing lane to left	2,293	1,036	45
Moving off	8,191	3,658	45
Turning left	7,261	2,730	38
Overtaking-nearside	1,547	363	23
Overtaking moving vehicle-offside	5,938	1,363	23
Overtaking static vehicle-offside	3,234	680	21
Going ahead other	128,758	19,793	15
Waiting to turn left	1,131	150	13
Waiting to turn right	4,807	512	11
Slowing or stopping	19,218	1,985	10
Going ahead left-hand bend	12,425	647	5
Going ahead right-hand bend	13,683	559	4
Waiting to go-held up	16,023	594	4
Parked	10,469	319	3
<b>All vehicles<sup>1</sup></b>	<b>269,312</b>	<b>52,378</b>	<b>19</b>

1 Includes unknown vehicle manoeuvres

**Table 4j: Vehicles with "failed to look properly" as a contributory factor, by vehicle and accident type: GB 2006**

Vehicle type	Percentage of vehicle type with failed to look as a contributory factor				
	Single Vehicle Accidents		Two vehicle accidents	Three or more vehicle accidents	All accidents
	No pedestrian casualties	With pedestrian casualties			
Pedal cycle	8	35	26	16	25
Motorcycle	5	21	16	14	15
Car	4	18	25	11	19
Bus or Coach	13	11	18	13	15
LGV	4	24	29	14	23
HGV	4	20	27	15	22
<b>All vehicles<sup>1</sup></b>	<b>5</b>	<b>18</b>	<b>25</b>	<b>11</b>	<b>19</b>

Includes only vehicles in road accidents where a police officer attended the scene and in which a contributory factor was reported.

1 Includes other vehicle types

Overall pedal cyclists are the most likely road user group to *fail to look properly*. However this is largely due to child (aged under 16) pedal cyclists. 46 per cent of child pedal cyclists *failed to look properly* compared to 19 per cent of adult pedal cyclists. LGV drivers are the most likely to *fail to look properly* in two vehicle accidents and bus or coach drivers are the most likely to *fail to look properly* in single vehicle accidents with no pedestrians. Over half of these buses/coaches also had *sudden braking* as a contributory factor. Motorcyclists were the least likely to *fail to look properly* followed closely by buses or coaches. In general drivers in two vehicle accidents are the most likely to *fail to look properly*. The following table concentrates on these kinds of accidents.

**Table 4k: Two vehicle accidents in which a driver or rider had "failed to look properly" as a contributory factor: GB 2006**

		Percentage of drivers who "failed to look properly"					
Vehicle 2 \ Vehicle 1		HGV	LGV	Bus or Coach	Car	Motorcycle	Pedal cycle
Pedal cycle		41	48	27	38	22	22
Motorcycle		34	50	27	47	18	
Car		28	26	17	22		
Bus or Coach		29	34	19			
LGV		14	16				
HGV		15					

X is the percentage of vehicle 1 type that had failed to look properly as a contributory factor in two vehicle accidents between vehicle type 1 and vehicle type 2.

Y is the percentage of vehicle 2 type that had failed to look properly as a contributory factor in two vehicle accidents between vehicle type 1 and vehicle type 2.

Table 4k shows, for two vehicle accidents, the percentage of each vehicle type that *failed to look properly* when in an accident with another vehicle type. Motorcycles are most likely to be in an accident with another vehicle that *failed to look properly*, particularly LGV drivers (50 per cent) and car drivers (47 per cent). By comparison motorcycle riders *failed to look properly* in only 16 per cent of accidents with LGVs.

LGV drivers are the most likely to *fail to look properly* in two vehicle accidents, not only in accidents with motorcycles but also in accidents with pedal cycles (48 per cent) and buses or coaches (34 per cent).

In accidents between vehicles types of different sizes, the driver of the larger vehicle is twice as likely to *fail to look properly* as the driver of the smaller vehicle. This is probably because smaller vehicles are more difficult to see.

Chart 4b shows that drivers or riders under 16 are the most likely to *fail to look properly* (43 per cent). However, almost all of these under 16s are pedal cyclists. In 2006 those between 40 and 49 were the least likely to *fail to look properly* (17 per cent), but above this age the factor increases with driver/rider age. There is little difference between the percentage of male drivers (20 per cent) and female drivers (19 per cent) who *failed to look properly*.

**Chart 4b: Percentage of driver/riders with failed to look properly as a contributory factor, by driver/rider age: GB 2006**

**Table 4I: Other contributory factors allocated to vehicles that had failed to look properly as a contributory factor: GB 2006**

Contributory Factors <sup>1</sup>	Percentage of vehicles
Failed to judge other person's path or speed	25
Careless, reckless or in a hurry	22
Poor turn or manoeuvre	21
Disobeyed 'Give Way' or 'Stop' sign or markings	7
Travelling too fast for conditions	6
Following too close	6
<b>Total number of vehicles with failed to look properly as a contributory factor</b>	<b>52,378</b>

<sup>1</sup> Includes only contributory factors attributed to over 5 per cent of vehicles which failed to look properly.

Over half of all drivers who had *failed to look properly* as a contributory factor also had one of three other factors – *failed to judge other person's path or speed* (25 per cent), *careless, reckless or in a hurry* (22 per cent) and *poor turn or manoeuvre* (21 per cent). All other individual factors were reported against less than 5 per cent of drivers who *failed to look properly*.

In 36 per cent of accidents with a bus or coach in which a car driver *failed to look properly* the car driver also had *poor turn or manoeuvre* as a contributory factor. The figure is similar for cars in accidents with motorbikes. Around a third of cars drivers who *failed to look properly* in accidents with HGVs also *failed to judge the HGV's path or speed*.

## 5. Hit and run accidents

*Penny Allen, Transport Statistics: Road Safety, Department for Transport*

The national accident statistics report form (previously known as STATS19) has recorded 'Hit and Run' vehicles for many years. However, these data have not been published in regular tables or articles in *Road Casualties Great Britain* since 1994. A one-off research report was published on hit and run accidents 1990–2002 in 2004.

A 'hit and run' injury accident (H&R) is one in which one or more of the driver's or rider's vehicles involved left the scene of an accident prematurely.<sup>1</sup> It is acknowledged that, where 'hit and run' is used on the form, it is likely that most information about the vehicle and its driver will be unknown. However, where this information becomes available later, for example where a 'hit and run driver' is pursued and caught, it should be entered in on the form.<sup>2</sup>

The public are understandably concerned about the risk of being involved in a hit and run accident. This is not simply because they expect a driver involved in an accident to stop, especially if there may be a casualty. It is also because people associate hit and run drivers with a wide range of motoring offences and therefore consider them to be a particular risk to other drivers. Only a small proportion of casualty accidents fall into this category, but it is important to monitor their frequency as an indicator of bad driving.

### Summary

This article examines trends in 'hit and run' accidents between 1997 and 2006, where these accidents occur, who is injured and which types of vehicles are involved. Key statistics include

- Eleven per cent of all reported personal injury road accidents involve at least one hit and run driver/rider. This accounts for 6 per cent of all vehicles and 10 per cent of all casualties. These proportions have remained relatively consistent over the past three years.
- The majority of H&R injury accidents and casualties are of slight severity (approximately 90 per cent).
- Over a fifth of fatal H&R injury accidents occurred between midnight and 4 am, whilst half of all H&R accidents happened between 9 am and 6 pm.
- Over 85 per cent of H&R injury accidents were on built-up roads, with over a third of all H&R accidents occurring on A roads.
- Fifty-six per cent of casualties in H&R injury accidents were car occupants, with a quarter of these being 20–29 years old.

<sup>1</sup> Broughton, J (2004) *Hit and Run accidents, 1990-2002, TRL Report TRL6512*

<sup>2</sup> Department for Transport (2004) *STATS20, Instructions for the completion of road accident reports*

## Accident, vehicle and casualty trends

Table 5a shows the annual numbers and percentages of H&R injury accidents by severity between 1997 and 2006. The total number of H&R injury accidents peaked in 2002, at 26,225 accidents. This has slowly declined to 21,006 in 2006, a 6 per cent reduction on the previous year. The number of fatal accidents however are at a similar level as in 2002, having dipped slightly in between.

The percentage of H&R injury accidents as a proportion of all road accidents has remained consistent over the past three years at 11 per cent. However, the number of H&R accidents has increased by 14 per cent since 1997, despite the number of all road accidents decreasing by 21 per cent over the same period.

**Table 5a: Reported personal injury road accidents involving at least one hit and run driver/rider:  
GB 1997 - 2006**

Year	Number of H&R accidents / Percentage of all accidents in category							
	Fatal		Serious		Slight		Total	
1997	113	3%	2,035	6%	16,209	8%	18,357	8%
1998	113	4%	1,933	6%	16,458	8%	18,504	8%
1999	132	4%	2,055	6%	17,788	9%	19,975	8%
2000	105	3%	2,276	7%	20,192	10%	22,573	10%
2001	129	4%	2,352	7%	22,300	11%	24,781	11%
2002	151	5%	2,673	9%	23,401	12%	26,225	12%
2003	147	5%	2,584	9%	23,490	13%	26,221	12%
2004	135	5%	2,182	8%	21,397	12%	23,714	11%
2005	146	5%	2,037	8%	20,084	12%	22,267	11%
2006	152	5%	1,917	8%	18,937	12%	21,006	11%

The majority (approximately 90 per cent) of all H&R injury accidents are of slight severity. One reason for expecting a H&R accident to be less severe is that at least one of the vehicles involved is relatively undamaged and can be driven away immediately afterwards. The slight accidents therefore dictate the trend of H&R accidents. Fatal accidents have represented less than 1 per cent of all H&R injury accidents in the past ten years; whilst serious accidents have represented approximately 10 per cent.

Chart 5a shows that serious and slight H&R accidents have shown a fall in the relative proportion since 2005, whilst fatal accidents have increased slightly.

**Chart 5a: Relative proportion of hit and run accidents to all reported personal injury road accidents, by severity : GB 1997- 2006**

Table 5b shows the number and percentage of vehicles reported to be involved in personal injury road accidents who left the scene, over the past ten years. There has been a 21 per cent decrease in the number of vehicles involved in road accidents in the past ten years. In this period, there has been a slight rise in the proportion of vehicles involved in H&R injury accidents, rising from 4 per cent in 1997 to 7 per cent in 2003 and currently at 6 per cent in 2006.

The police officer at the scene of the accident may also code the hit and run question as ‘non-stop vehicle, not hit’. This includes cases where a vehicle was involved in an accident but did not or was not hit, and therefore left the scene of an accident. The driver’s actions cannot be described as ‘hit and run’ because they may not have been aware of the accident. Information about the driver and vehicle is not known, and is therefore not included in our hit and run statistics.

**Table 5b: Vehicles involved in reported personal injury road accidents, by hit and run status: GB 1997-2006**

Year	Number/Percentage of vehicles					
	Hit And Run		Non/stop Vehicle not hit		All accidents	
1997	18,872	4%	3,571	1%	438,877	100%
1998	19,159	4%	3,856	1%	437,105	100%
1999	20,789	5%	4,061	1%	430,492	100%
2000	23,447	5%	4,526	1%	429,943	100%
2001	25,905	6%	4,369	1%	420,073	100%
2002	27,543	7%	4,319	1%	408,325	100%
2003	27,161	7%	4,097	1%	392,022	100%
2004	24,313	6%	4,156	1%	379,845	100%
2005	22,918	6%	5,265	1%	366,236	100%
2006	21,562	6%	4,761	1%	348,059	100%

Casualties resulting from H&R injury accidents over the same period have shown a similar trend to H&R accidents, as shown in Table 5c. In 2006, slight casualties represented over 90 per cent of all H&R casualties, whilst fatalities and serious casualties represented less than 1 per cent and 8 per cent respectively. In 2006, there had been a 6 per cent decrease in the number of casualties resulting from H&R accidents since 2005.

The percentage of H&R casualties as a proportion of all road accident casualties has remained at 10 per cent over the past three years. However, the number of H&R casualties has increased by 16 per cent over the last ten years, despite there being a 21 per cent decrease in all casualties resulting from road accidents over the same time period.

**Table 5c: Casualties resulting from reported personal injury road accidents involving at least one hit and run driver/rider: GB 1997 - 2006**

Year	Number of H&R casualties / Percentage of all casualties in category							
	Fatal		Serious		Slight		Total	
1997	119	3%	2,213	5%	19,361	7%	21,693	7%
1998	118	3%	2,131	5%	19,613	7%	21,862	7%
1999	134	4%	2,239	6%	21,469	8%	23,842	7%
2000	111	3%	2,495	7%	24,656	9%	27,262	9%
2001	132	4%	2,553	7%	27,158	10%	29,843	10%
2002	154	4%	2,924	8%	28,649	11%	31,727	10%
2003	154	4%	2,840	8%	28,862	11%	31,856	11%
2004	145	5%	2,364	8%	26,033	11%	28,542	10%
2005	150	5%	2,187	8%	24,345	10%	26,682	10%
2006	153	5%	2,055	7%	22,885	10%	25,093	10%

Chart 5b shows the increase in the percentage of H&R injury accidents and casualties as a proportion of all personal injury road accidents and casualties since 1997, where H&R accidents represented 8 per cent and casualties 7 per cent, to a peak in 2003 where accidents were 12 per cent and casualties were 11 per cent of all accidents. Since 2003, there has been a gradual decline in the relative proportion of H&R injury accidents and casualties for all severities, except for fatal H&R accidents and casualties (Chart 5a).

**Chart 5b: Relative proportion of hit and run accidents and casualties to all reported personal injury road accidents and resulting casualties: GB 1997- 2006**

## Time of day

Table 5d shows that in 2006 half of all H&R injury accidents occurred between 9am and 6pm, with a further 22 per cent occurring between 6pm and 10pm. Fatal accidents were more likely to occur during evening hours than daytime. Conversely, slight accidents occurred more frequently during daytime.

A greater proportion of H&R injury accidents occurred during 18:00–03:59 than all road accidents at these times. Conversely, from 09:00 to 17:59 there was a lower proportion of H&R injury accidents occurring than in all road accidents.

**Table 5d: Reported personal injury road accidents involving at least one hit and run driver/rider, by time of accident: GB 2006**

Time of accident	Number/Percentage of accidents									
	H&R accidents						All accidents			
	Fatal		Serious		Slight		Total		Total	
00:00 - 03:59	34	22%	250	13%	1,453	8%	1,737	8%	9,026	5%
04:00 - 08:59	18	12%	210	11%	2,152	11%	2,380	11%	26,508	14%
09:00 - 17:59	31	20%	773	40%	9,724	51%	10,528	50%	107,011	57%
18:00 - 21:59	40	26%	457	24%	4,210	22%	4,707	22%	36,440	19%
22:00 - 23:59	29	19%	227	12%	1,397	7%	1,653	8%	10,158	5%
Total <sup>1</sup>	152	100%	1,917	100%	18,937	100%	21,006	100%	189,161	100%

<sup>1</sup> Includes cases where time is missing

The percentage of casualties resulting from H&R injury accidents was similar to that for H&R accidents.

## Location

Table 5e shows the breakdown of H&R injury accidents by severity and road types. Over one-third of H&R injury accidents occurred on A roads, of which a quarter were on 30 mph roads. The vast majority of H&R injury accidents happened on built-up roads (86 per cent), whilst only 3 per cent of H&R injury accidents were on motorways. This concurs with the fact that slight accidents represent over 90 per cent of all H&R accidents, and lower speeds tend to be associated with less damage to the vehicle involved.

**Table 5e: Reported personal injury road accidents involving at least one hit and run driver/rider, by road type: GB 2006**

		Number/Percentage of H&R accidents					
		FSA <sup>1</sup>		Slight		Total	
All built up roads <sup>2</sup>	A roads	627	3%	6,001	29%	6,628	32%
	B roads	207	1%	1,846	9%	2,053	10%
	Other roads	929	4%	8,397	40%	9,326	44%
	All roads	1,763	8%	16,244	77%	18,007	86%

<sup>1</sup> Fatal or serious accident

<sup>2</sup> Excludes motorways

## Vehicle and road user types

Table 5f shows the number and percentage of H&R vehicles involved in accidents by vehicle type. In 2006, 83 per cent of H&R vehicles were cars. Since cars were involved in 77 per cent of all personal injury road accidents, other vehicles are therefore under-represented in H&R accidents, especially pedal cycles and motorcycles.

**Table 5f: Hit and Run vehicles involved in reported personal injury road accidents involving at least one hit and run driver/rider, by vehicle type: 2006**

Road user type	Number/Percentage of vehicles									
	H&R accidents								All accidents	
	Fatal		Serious		Slight		Total		Total	
Pedal cycle	1	0%	23	0%	205	1%	229	1%	16,611	5%
Motorcycle	7	0%	110	1%	557	3%	674	3%	24,323	7%

<sup>1</sup> Includes all road user types and cases where road user type was not reported

Table 5g shows that, in all H&R injury accidents, 60 per cent of resulting casualties were male. A quarter of casualties were 20–29 years old, whilst the age group 80–99 years was the only age group where there were more female than male casualties reported. Over half of H&R casualties were aged 20–49 years. This pattern is similar to the overall pattern of road casualties.

**Table 5g: Casualties resulting from reported personal injury road accidents involving at least one hit and run driver/rider, by age and gender: GB 2006**

Age of casualty	Number/Percentage of casualties							
	H&R casualties						All casualties

<sup>1</sup> Includes cases where gender was not reported

<sup>2</sup> Includes cases where age was not reported

Charts 5c(i) and (ii) show the proportion of casualties involved in H&R injury accidents, by casualty type, compared with the same proportions for all accidents. A smaller proportion of car occupants were involved in H&R injury accidents than in all accidents (56 per cent compared to 66 per cent), whilst a greater proportion of pedestrians and pedal cyclists were involved in H&R injury accidents than in all accidents (34 per cent compared to 18 per cent).

**Chart 5c(i): Casualties involved in H&R accidents, by casualty type: GB 2006**

**Chart 5c(ii): Casualties involved in all accidents, by casualty type: GB 2006**

## Regional

In 2006, nearly one-third of all H&R injury accidents and resulting casualties occurred in the North West (approximately 15 per cent) or London (approximately 18 per cent). The North East, Wales and Scotland had the lowest number of H&R injury accidents and resulting casualties (4 per cent). The regional breakdown of H&R injury accidents is shown in Table 5i.

**Table 5i: Reported personal injury road accidents involving at least one hit and run driver/rider, by government office region: GB 2006**

Government Office Region	Number/Percentage of H&R accidents					
	FSA <sup>1</sup>		Slight		Total	
North East	86	4%	714	4%	800	4%
North West	289	14%	2,825	15%	3,114	15%
Yorkshire and the Humber	192	9%	1,749	9%	1,941	9%
East Midlands	154	7%	1,193	6%	1,347	6%
West Midlands	200	10%	2,178	12%	2,378	11%
East of England	180	9%	1,571	8%	1,751	8%
South East	216	10%	2,226	12%	2,442	12%
London	452	22%	3,370	18%	3,822	18%
South West	109	5%	1,484	8%	1,593	8%
Wales	67	3%	850	4%	917	4%
Scotland	124	6%	777	4%	901	4%
Great Britain	2,069	100%	18,937	100%	21,006	100%

<sup>1</sup> Fatal or serious accidents

The relative proportion of H&R injury accidents, comparing the number of H&R injury accidents to the total number of reported personal injury road accidents, shows that London, West Midlands and North West have the highest proportions (15, 13 and 13 per cent respectively). Scotland has the lowest proportion (7 per cent). The relative casualty proportions are similar. These patterns are likely to be associated with the patterns shown by road type in Table 5e.

## 6. The use of hospital data on road accidents

*Chris Roebuck, The Information Centre for Health and Social Care*

### Key points

- Hospital Episodes Statistics (HES) is a key source of information on the medical outcomes of more serious road accidents. This article describes the differences between HES and police data (STATS19), which is the main source used to track casualty rates, and explains why HES data have to be used with care for trend analysis.
- Pedal cyclist casualties account for 17 per cent of HES road traffic accident casualties in England, but only 8 per cent in the STATS19 dataset. Accidents in which the pedal cyclist did not collide with another vehicle or object account for 60 per cent of the HES pedal cyclist casualties, but only 5 per cent of STATS19 pedal cyclist casualties.
- Pedal cyclists admitted to hospital following collisions with motor vehicles are most likely to have injuries to the head or face (49 per cent) or legs or hips (36 per cent). Accidents in which there was no direct collision result in more injuries to the arms/shoulders (47 per cent).

### Introduction

For many years, the police have provided data on road accidents reported to them involving casualties, under the 'STATS19' system. This source provides almost all the data in this publication.

During the 1990s, a new source of information on road traffic accidents for England became available, known as Hospital Episode Statistics (HES). Similar systems also exist in Wales (Patient Episode Database for Wales) and Scotland (Scottish Morbidity Record). HES is potentially an excellent source of information on the medical outcomes of road accidents, but coverage and trends in road accidents from the police and hospital sources differ in many ways.

This article:

- explains the differences between STATS19 and HES as data sources on road accidents
- considers factors affecting the analysis of trend data from HES
- gives an example of the type of analysis that can be done, using HES data on cycling casualties.

## Hospital Episode Statistics (HES)

HES data on patient admissions for each 'Finished Consultant Episode' (FCE) are collected on behalf of the Information Centre for Health and Social Care (IC), having been submitted by hospitals from their local systems, known as 'Patient Administrative Systems'. The most significant purpose for hospitals submitting the information from their local systems is ensuring the correct funding of hospitals by charging the Primary Care Trust (PCT) responsible for the patient.

Each HES record contains clinical details of the patient's condition, coded to the International Classification of Diseases (ICD). The ICD codes allow the identification of patients whose injuries have been caused by a road traffic accident. The 10<sup>th</sup> revision of ICD (ICD10)<sup>1</sup> was introduced into the HES system in 1996. In contrast to ICD9, details of the vehicles involved are included, and so from 1996 the HES system became a useful source of information on road casualties.

### ICD10 codes

Every diagnosis of injury or poisoning (ICD10 codes in sections S and T) should also be given an 'external cause', covered by codes in section V. The codes covering land transport accidents are V01 to V89. Accidents involving trains and non traffic injuries are then removed to identify road traffic accidents.

**Chart 6a: Percentage of (a) road traffic admissions and (b) seriously injured casualties by road user type: England 2005/2006**

Chart 6a shows that casualty data from HES and STATS19 have broadly similar breakdowns by road user type. The most significant difference is between the proportions of pedal cyclists, accounting for 17 per cent of HES admissions, but only 8 per cent of STATS19 serious casualties.

As an example of the type of analysis that can be done using HES data, pedal cycle casualties are explored in more detail later in this article.

<sup>1</sup> ICD10 <http://www.who.int/classifications/apps/icd/icd10online/>

## Comparisons between HES and STATS19 definitions

There are many definitional differences between HES and STATS19. These are summarised in the table below.

	STATS19	HES
Coverage	<p>Confined to accidents on the public highway involving injury reported to the police, including slight injuries where patients are not admitted to hospital</p> <p>Excludes confirmed suicides; death from natural causes; injuries to pedestrians with no vehicle involvement (e.g. falls)</p>	<p>Covers only patients <u>admitted</u> to hospitals, which currently excludes attendance at A&amp;E only. Includes accidents not reported to the police.</p> <p>ICD codes allow non-traffic accidents to be excluded, but only where they are known to have taken place off the highway. Accidents are assumed to have occurred on the public highway unless another place is specified.</p> <p>Excludes patients not admitted to hospital, e.g. treated in A&amp;E, by GPs etc, or not requiring professional treatment.</p>
Fatalities	<p>Almost all fatalities within 30 days of the accident are likely to be recorded</p>	<p>Many fatalities take place at the scene of the crash or in A&amp;E, and are never admitted to hospital.</p> <p>Fatalities can be identified in HES, but deaths may be later than 30 days after the accident. These are identifiable if they are still in hospital when they die.</p>
Details of injury, including severity	<p>Fatal, serious or slight only.</p> <p>'Serious' accidents include all admitted to hospital or any of the following injuries: fractures, concussion, internal injuries, crushings, non-friction burns, severe cuts, severe general shock requiring medical treatment and any injuries causing death 30 or more days after the accident.</p> <p>Note that severity is judged by the police, who are not medical experts and may misclassify serious injuries as slight or vice versa.</p>	<p>Very detailed coverage of medical diagnosis using ICD codes.</p> <p>Intensive investigations are likely to lead to much more accurate severity diagnosis</p>

	STATS19	HES
Duplicate records	Unlikely	Records created for each 'finished admission episode'. The same patient can be counted more than once if they are discharged from hospital and then readmitted.
Details of accident	Extensive, including all vehicles involved, location of accident	Few – confined to identifying vehicle type(s) or pedestrian involved.
Patient details	Age (may be estimated), sex, home address postcode in about 75 per cent of cases	Likely to be fuller and more accurate, including home postcode in most cases.

In spite of these differences, it is possible to manipulate HES data to be broadly comparable to STATS19, and this has been done in earlier studies.<sup>2,3</sup> In particular, fatalities, off-road casualties and duplicate records should be removed from the HES data, and comparisons between the sources are only possible for those classified by STATS19 as 'serious'. All HES admission data in this article are finished in year emergency admissions, excluding non traffic accidents and in-hospital deaths. A full list of ICD10 codes used to compare with STATS19 road accidents can be found on the web tables accompanying this article on the DfT's website.<sup>4</sup>

In addition to definitional differences between STATS19 and HES, trends in the sources may also differ due to a combination of a number of factors, including:

- Changes in hospitals' practices or in how they record their data, particularly changes to the comparatively new HES system over time
- A change in the proportion of road casualties admitted to hospital
- A genuine change in the number of less severe, non-hospitalised casualties which are still classed as "serious" in STATS19 – many such cases will be handled in A&E only, and therefore are not recorded in the HES statistics
- Changes in the police recording of injury severity
- A change in the level of reporting of accidents by the public to the police. Note that there is not a duty on the public to report all personal injury road accidents to the police.<sup>5</sup>

The first point is covered in the following section.

<sup>2</sup> Road Safety Research Report No.69: Under-reporting of Road casualties Phase 1 <http://www.dft.gov.uk/pgr/roadsafety/research/rsrr/theme5/underreportingofroadcasualti4788>

<sup>5</sup> Legal requirement <http://www.collisionreporting.gov.uk/Law/default.asp>

## Development of Hospital Episode Statistics (HES)

As the HES system has evolved, there have been a number of significant factors which over time have led to considerable improvements and changes to the data. The HES website<sup>6</sup> contains the following warning:

Please exercise care when comparing HES figures for different years.

Fluctuations in the data can occur for a number of reasons, e.g. organisational changes, reviews of best practice within the medical community, the adoption of new coding schemes and data quality problems that are often year specific. These variations can lead to false assumptions about trends.

We advise users of time series data to carefully explore the relevant issues before drawing any conclusions about the reasons for year-on-year changes.

These organisational and administrative changes are discussed in this section.

### Length of admissions from A&E

Chart 6b shows the number of nights casualties spent in hospital following admission from A&E. The proportion of short stay admissions of 0 or 1 day was almost constant from 1995/96 to 2002/03, accounting for about 40 per cent of all road casualty admissions of known duration. This proportion grew to 47 per cent in 2005/6.

**Chart 6b: Road traffic admissions from A&E, by length of stay:  
HES 1995/1996 - 2005/2006**

The overall increase in admissions of 17 per cent from 2002/3 to 2005/6 is accounted for by the increases in admissions of 0 days (up 79 per cent) and 1 day (up 18 per cent), and also of unknown duration (up 30 per cent). Admissions of 2 or more days slightly decreased (by 4 per cent) over this period.

<sup>6</sup> HES website warning on trends [www.hesonline.nhs.uk/Ease/servlet/ContentServer?siteID=1937&categoryID=484](http://www.hesonline.nhs.uk/Ease/servlet/ContentServer?siteID=1937&categoryID=484)

**Chart 6c: Trends in admissions from A&E by length of stay:  
HES 1995/96 to 2005/06**

It is likely that road casualty admissions are being driven by changes affecting all admissions from A&E. Chart 6c shows overall trends (in index form) in admissions from A&E of duration 0 and 1 day, compared with 2 or more days. The impact of changes from 2002/03 to 2005/06 is pronounced. Overall admissions of 0–1 days rose by 75 per cent, from 700 to 1,200 thousand. In contrast there was a 1 per cent fall in admissions of 2+ days, from 890 to 879 thousand.

Chart 6c also shows road casualty admissions from A&E of 0–1 days, which increased from 13 to 18 thousand (39 per cent) from 2002/03 to 2005/06. This change was about half of that seen in total admissions from A&E of this length.

Increasingly, practice for patients requiring short periods of observation and assessment has been to use assessment or short-stay admission wards, determined locally, for monitoring and for the benefit of the patient.

The rise in road traffic emergency admissions via A&E does not therefore necessarily equate to an actual rise in the number of road traffic accidents but more likely reflects a change in practice over this time.

### **Coverage, coding and IT systems**

All hospitals have contributed to HES since its inception with full data held for 1989/90 onwards. There is a target for hospitals to provide 98 per cent of coded data to a central unit within two months.

Since 1996 there has been increased validation of external cause codes and other improvements in coding. In addition, an improved IT system (HES2) was introduced in 2002/03, which allowed for 14 diagnosis codes, rather than seven previously. Some road casualties with extensive injuries would require more than seven codes, and as the external cause is always the last in the sequence, some road casualties would not have been recorded as such. Thus the noticeable increase in road casualty numbers from 2002/03 described above may also have been partly caused by this improvement in coding.

## Payment by results

The recent introduction of 'Payment by Results'<sup>7</sup> has led to a step change in the importance of HES to the NHS, and hence of the accuracy and number of ICD10 codes attributed to each FCE. Each PCT is charged for the hospital treatment of its residents, according to such factors as the length of stay in hospital, the severity and number of their conditions, and other factors such as the age of the patient.

Payment by results and a continuing effort to improve the accuracy of coding mean that there are likely to be further improvements (and hence changes) to HES in the future.

## Understanding trends in road accidents using HES and STATS19

The purposes of the HES and STATS19 datasets are different, although both are derived from administrative sources. STATS19 was developed to provide detailed statistical reports of road casualties, and has aimed to provide consistent data for trend analysis over time. However, this relies on levels of reporting of road casualties to the police remaining constant, and there is some evidence that this may not be the case.<sup>2,3</sup>

HES road casualty data are a by-product of a source whose key purpose is to provide administrative and medical data to the health service. HES data are currently difficult to use for monitoring trends in road casualties for the reasons discussed above. However, HES may develop into a very powerful source if it proves possible to link information on the circumstances of road accidents in STATS19 with medical information on casualties, with the potential to improve road safety and treatment. This is discussed in more detail below.

## Combining data sources

Plans are progressing to match individual HES and STATS19 records. Initially, this will be used to estimate proportions of known road casualties appearing in both sources, in HES only, and in STATS19 only. Seeing how these proportions have changed in recent years may help to understand trends in road casualties which appear in either or both sources, but will not enable an estimate to be made of all road casualties as many will not appear in either source. The challenge will be to achieve a high level of matching, but it is not a straightforward process as there are only limited fields (age, postcode of home address, gender, type of casualty, location, date of accident) on which to match.

---

<sup>7</sup> Payment by results

<http://www.dh.gov.uk/en/Policyandguidance/Organisationpolicy/Financeandplanning/NHSFinancialReforms/index.htm>

In the longer term an anonymised matched database will have considerable potential use for research into the medical consequences of road accidents, and should provide a powerful evidence base for the development of effective policy to improve road and vehicle safety, reduce the risk of injury and inform the treatment of casualties. Such databases exist already, including:

- STATS19 and the Scottish hospital data (SHIPS) – linked datasets were created on an ad-hoc basis by the Transport Research Laboratories (TRL) for the research projects which are described in TRL Report 420 (1999).<sup>8</sup>
- The Co-Operative Crash Injury Study (CCIS) has been investigating real-life car collisions in the UK since 1983 to understand car-occupant injury causation. In each investigation, a detailed examination of a collision-damaged car is correlated with the injuries to the occupants.
- Data in a number of states of the USA, using 'CODES' software for probabilistic matching.<sup>9</sup>
- A number of EU countries are also looking at linking road accident data and hospital data.<sup>10,11</sup>

## Other data sources

In the longer term we may be able to make use of other sources of data that will help us to understand trends in road traffic accidents, e.g. attendance at A&E, information from emergency services, and from the insurance industry, but at present these data are not available to a common format or submitted to central databases.

The Scottish Household Survey has included questions about road accidents in interviews conducted from February 1999 to March 2003, and from 2005 onwards.<sup>12,13</sup> Following a pilot in the Office of National Statistics's Omnibus survey<sup>14</sup> questions on road accidents were also added to the DfT's National Travel Survey (NTS) in January 2007. The first data will be available in summer 2008. In future, the NTS will provide an independent, non-administrative source, but sample sizes will be too small to provide any information other than broad trends at the national level.

## HES pedal cyclists casualties

This section uses HES data to look at pedal cyclist road accident casualties. Pedal cyclists are among the most vulnerable road users but previous research has shown that they are underrepresented within STATS19.<sup>3</sup> Chart 6a shows that in England in the financial year 2005/2006 pedal cyclists accounted for 8 per cent of all seriously injured casualties in STATS19, and 17 per cent of emergency road traffic admissions recorded in HES.

**Table 6a: Pedal cyclist casualties, by collision type: England 2005/2006**

Collision type	HES		STATS19	
	Number	Per cent	Number	Per cent
No collision <sup>1</sup>	4,268	60	101	5
Collision with <sup>2</sup> :	2,186	31	1,899	91
Object	242	3	100	5
Pedestrian / animal	34	0	4	0
Cyclist	89	1	12	1
Motorcycle	50	1	42	2
Car / LGV	1,592	23	1,616	77
HGV / Bus	102	1	109	5
Other vehicle	77	1	16	1
<b>Total<sup>3</sup></b>	<b>7,065</b>	<b>100</b>	<b>2,092</b>	<b>100</b>

<sup>1</sup> HES: Fall or thrown from pedal cycle (without antecedent collision),

STATS19: Single vehicle accidents, no pedestrian/animal, no object hit.

<sup>2</sup> STATS19: If a pedal cyclist has been recorded as colliding with an object and is involved in an accident with another vehicle, only the collision with the object will be shown here.

<sup>3</sup> Includes accidents in which it is unknown whether the pedal cyclists collided with a vehicle or object.

Table 6a compares the collision types for admissions in HES with those in STATS19. Pedal cyclists injured in road accidents who are admitted to hospital are included in STATS19 as seriously injured casualties, provide they are reported to the police. However, in 2005/2006 there were about two thousand seriously injured pedal cyclists casualties in STATS19 in England, compared to about seven thousand hospital admissions recorded in HES (both excluding deaths).

Accidents in which the pedal cyclist did not collide with another vehicle or object (for example falls or throws) account for the majority of this difference. They make up only 5 per cent of seriously injured casualties in STATS19 but account for 60 per cent of admissions in HES. This disparity may be due to a couple of factors. Firstly, if the location of the accident is not specified in the patient's records it will be assumed that it was a traffic accident. This may mean that some off-road accidents are included and non-collision accidents may be particularly vulnerable to this. Secondly, accidents in which the pedal cyclist is the only participant are relatively unlikely to be reported to the police.

For pedal cyclist accidents involving motorcycles, cars, goods vehicles and buses there is little difference between the number of pedal cyclist casualties in HES and STATS19.

Charts 6d and 6e shows the distribution of HES admissions and STATS19 seriously injured casualties by age for all accidents (6d) and collision only accidents (6e).

**Chart 6d: All pedal cyclist road traffic casualties by age:  
England 2005/2006**

The biggest difference between the numbers in HES and STATS19 is for children (aged 0-15) for whom there are 6 times as many admissions in HES as there are seriously injured casualties in STATS19. However, 70 per cent of the admissions in this age group were not the result of a collision accident. 2,006 of the 4,268 (47 per cent) non collision accident admissions were children, compared to 610 of the 2,186 (28 per cent) collision accident admissions.

The smallest difference between the two sources is for pedal cyclists aged 20-29, for whom there are twice as many admissions in HES as seriously injured casualties in STATS19.

**Chart 6e: Collision only pedal cyclist road traffic casualties by age:  
England 2005/2006**

The two series more closely resemble each other when accidents in which there was no collision are excluded as shown in chart 6e. There are still more child and aged 50 and over pedal cyclist admissions in HES than seriously injured casualties in STATS19 but the reverse is true for cyclists aged 20 to 39.

There is also a relatively minor difference between HES and STATS19 in the proportion of pedal cyclist casualties that are male or female. 82 per cent of seriously injured casualties in STATS19 are male compared to 79 per cent of admissions in HES. This difference is more pronounced for child casualties – 85 per cent of child casualties in STATS19 are male, compared to 79 per cent in HES.

**Percentage of road traffic pedal cyclist admissions with injuries to each body region: HES 2005/2006**

Percentages add up to more than 100 as a casualty may have injuries to more than one body region.

The illustration shows the distribution of injuries to pedal cyclists admitted to hospital. Most admissions are as a result of injuries to the head/face or to the arms/shoulders. However the legs/hips were injured in around a quarter of admissions. Neck injuries were involved in only 2 per cent of admissions. This compares to 14 per cent of car users who were admitted with an injured neck.

**Table 6b: Pedal cyclist admissions, by collision type and body region: HES 2005/2006**

Body region	In collision with:				No collision <sup>1</sup>		All admissions <sup>2</sup>	
	Motor vehicle		Object		Number	per cent <sup>3</sup>	Number	per cent <sup>3</sup>
Head/face	897	49	115	48	1,504	35	2,785	39
Legs/hips	662	36	53	22	850	20	1,716	24
Lowerback/pelvis	209	11	23	10	281	7	575	8
Neck	51	3	12	5	42	1	120	2
Upperback/Thorax	180	10	13	5	115	3	339	5
Arms/shoulders	608	33	95	39	2,015	47	3,021	43
All injuries <sup>3</sup>	1,818	100	242	100	4,268	100	7,065	100

<sup>1</sup> Fall or thrown from pedal cycle (without antecedent collision)

<sup>2</sup> Includes collisions with pedestrians, animals, other cyclists and other non motor vehicles

<sup>3</sup> Percentages may add up to more than 100 as a casualty may have injuries to more than one body region. Percentages for neck, upper back/thorax and arms/shoulders should be treated with caution as they are based on small numbers.

Table 6b shows which collisions results in which type of injuries. Pedal cyclists admitted following collisions with motor vehicles are most likely to have injuries to the head or face (49 per cent) or legs or hips (36 per cent). Accidents in which there was no direct collision result in more injuries to the arms/shoulders (47 per cent). These accidents result in a much lower proportion of head/face injuries (35 per cent) than collision accidents. This may be because these cases are largely falls or throws in which the cyclist is more likely to be able to protect their head using their arms, which results in more arm / shoulder injuries.

**Chart 6f: Pedal cycle admissions by duration and collision type:  
HES 2005/06**

Chart 6f shows the duration of emergency admissions by the type of collision the pedal cyclist was in. Pedal cyclists who had no collision tend to be admitted for shorter periods than those in collisions with motor vehicles or other objects. 86 per cent of casualties in no collision accidents were admitted for less than 4 days compared to 80 per cent of those in collisions with objects and 73 per cent of those in collisions with motor vehicles.

This information from HES allows us to begin to look at the relationship between accident circumstances and the resulting injuries. However a matched STATS19 / HES database will allow us to look into greater detail at this relationship. For instance, in the case of pedal cyclists, the matched database could use the first point of contact information from STATS19 with the diagnostic information from HES to help us to understand the cause of injuries to particular parts of the body. Or it may allow us to look at how the severity and kind of injuries in accidents between cyclists and motor vehicles changes if the motor vehicle was exceeding the speed limit.

**Acknowledgements**

DfT would like to thank the staff at the Information Centre for helping us to understand HES, and contributing to this paper, especially Chris Roebuck, Kate Croft and John Reed.

## Notes

The main tables in this publication analyse road accidents, casualties, the vehicles involved and their drivers. Both numbered and lettered tables are included in the index at the end of the volume.

The statistics refer to personal injury accidents on public roads (including footways) which become known to the police. For the definition of accidents included see "Definitions, symbols and conventions". In particular, the following are not included:

- (a) damage-only accidents, with no human casualties.
- (b) accidents which do not become known to the police, or which only become known 30 or more days after their occurrence.
- (c) reported accidents not recorded.

Very few, if any, fatal accidents do not become known to the police<sup>1</sup>. However, research has shown that an appreciable proportion of non-fatal injury accidents are not reported to the police and thus are not included in this publication. There is no legal obligation to report accidents, provided the parties concerned exchange personal details at the scene. In addition a fifth of casualties reported to the police were estimated to be unrecorded. Studies confirm the view that the police are more likely to underestimate severity of injury because of the difficulty in distinguishing severity at the scene of the accident. The Department has recently (June 2006) published two further reports, *Under-reporting of road accidents: Phase 1 (Road Safety Research Report 69)* by Heather Ward, Ronan Lyons and Roselle Thoreau which includes a review of earlier studies and provides estimates of this shortfall and the related document, *Road accident casualties: a comparison of STATS19 data with Hospital Episodes Statistics*. Consistent data is required for monitoring trends, this relies on levels of reporting of road accidents remaining constant, however some doubts have been raised that this may not be the case. The Department is undertaking further research to investigate whether levels of reporting have changed. Further information on levels of reporting can be found on the Department's website at:

<http://www.dft.gov.uk/pgr/statistics/datatablespublications/accidents>

From the beginning of 2005 most police forces in England and Wales adopted a standard form, MG NCRF, for reporting road accidents. The statistics pages for this report are reproduced in this volume. Instructions for the Completion of Road Accident Reports (STATS20, 2005), a manual published by the Department for Transport, the Scottish Executive and the Welsh Assembly, gives more detail on the definitions used in collection. Copies are available on the Department's website at the address below, or may be obtained from the Department for Transport, Zone 3/19, Great Minster House, 76 Marsham Street, London, SW1P 4DR (Tel 020 7944 ext 3078).

<http://www.dft.gov.uk/pgr/statistics/datatablespublications/accidents/casualtiesqbar/stats20instructionsfortheform5094>

Relevant background data on population, vehicle stock, traffic, road length, etc, are also given in tables 1a, 1b, 40, 42 and 46a. In 2000, the September fuel dispute led to a decline in car and taxi traffic for that year. The widespread outbreak of Foot and Mouth disease in 2001 and the control measures put in place also had an effect on traffic. Further information is available in *Road Statistics 2006: Traffic, Speeds and Congestion*.

<http://www.dft.gov.uk/pgr/statistics/datatablespublications/roadtraffic/speedscongestion/roadstatistics/roadstats06tsc>

---

<sup>1</sup> Up to and including 1983 there were some missing details of fatalities in the Metropolitan Police district (see Road Accidents Great Britain 1984)

Tables 5-7c, 30b, 38b and 46b in the main body of tables of the report include an average of aggregated accident and casualty data for the years 1994 to 1998. The average for these years represents the baseline figure for the national road casualty reduction targets. All data in the main body of tables which relate to children refer to persons aged 0-15 unless otherwise stated. Table 12 summarises the numbers of accidents, casualties and vehicles involved in road accidents which are available for detailed analysis in 2006. Tables 46a and b show these totals by local authority; the individual figures are, however, liable to differ slightly from those available locally because local authorities may continue to incorporate corrections long after the end of the year.

The detailed analyses of casualty, driver and vehicle details and of accident circumstances give totals which vary slightly from table to table because of occasional incomplete reporting of the relevant details. However, the general relationship between the various sub-totals is not materially affected.

## Notes to individual main tables

**Table 2.** The completeness of reporting injuries may vary over such a long time period. The reporting rate is especially influenced by public attitudes about reporting to the police, and the police awareness of the requirement to collect a defined long range of slight injury accidents.

**Table 11.** The figures relate to drivers (or riders) of cars, motor vehicles and motorcycles involved in accidents, whether or not the driver was a casualty. The first line gives the number of all such drivers of accident involved vehicles, including those who were not with their vehicles or not contacted by the police, as well as cases where injury or circumstances would have prevented a breath test. The second line gives the number required to take a breath test near the place of the accident, or at a hospital in the case of a casualty admitted there as a patient, provided the doctor in charge of the patient has not objected; it does not include breath tests at a police station following an arrest. The fourth line gives the number of positive tests, which indicated a breath alcohol concentration in excess of 35 micrograms per 100 millilitres of blood, plus the number of drivers required to provide a breath test who either refused or failed to provide a specimen of breath. No account is taken of whether or not a possible second breath test, or blood or urine test, confirmed the results, and whether or not a prosecution followed.

**Table 12.** The casualties in columns 3 to 6 are those resulting from the accidents in column 1. They are classified by severity of injury suffered by the casualty (columns) and by the severity of accident, i.e. of the most severely injured casualty in the accident (rows).

**Table 13.** Provides for each speed limit in common use, the number of accidents and casualties on major roads – motorways (including A(M) roads) and A roads – and on minor roads. An accident on a road with any other limit is included with those of the next higher limit.

**Table 14.** The total number of accidents is classified according to the number of each severity of injury resulting from them.

**Table 16.** “Raining” includes drizzle, hail and sleet not tending to build up a deposit. “Snowing” includes sleet building up a deposit. “Fog” does not include light mist if it does not constitute a driving hazard on the road where the accident occurred.

**Table 18.** Carriageway hazards are recorded as such, whether or not the animal or object concerned was hit and whether or not its presence is known to have contributed to the accident. “Other object in carriageway” comprises those not expected to be found in the carriageway; it does not include permanent features such as a bollard or pedestrian refuge. “Animal in carriageway” includes led animals, but not ridden horses which are recorded separately on the accident statistics report.

**Table 19.** An accident is considered to be at a junction if it is within 20 metres of an intersection or roundabout. Grade separated crossings (by bridge or underpass) are not junctions. “Roundabout” includes mini-roundabout junctions, “T junction” includes slip roads joining dual carriageways. “Crossroads” includes only junctions where the alignments of both of the roads are uninterrupted, whatever the angle of the crossing, i.e. the arms are not staggered. If there is more than one junction within 20 metres of the accident, the nearest is coded.

**Table 20.** This table only covers accidents where one vehicle is involved. It does not cover accidents involving two or more vehicles.

**Table 21.** In column 6, “other combination” means one or both vehicles not a car.

**Table 23 a (Urban Roads), b (Rural Roads) and c (All Roads).** Columns 1 and 2 give, for each vehicle type, the number of accidents in which only one such vehicle was involved, showing the user casualties and any pedestrian casualties involved; e.g., in Table 23c, 380 accidents involved only a pedal cycle, giving rise to 384 cyclist casualties (riders and passengers); a further 202 accidents also involved 205 pedestrian casualties as well as 60 cyclist casualties.

Columns 3 to 10 analyse two-vehicle accidents according to both vehicle types, also giving, by severity of injury, the casualties for the users of the vehicle class defined on the left (under vehicle A) and pedestrians who were (first) hit by vehicles of that class. Thus 13,182 accidents involved a pedal cycle and a car, resulting in 13,112 pedal cyclist casualties and 15 pedestrian casualties hit by the pedal cycle. The car user casualties and pedestrians hit by cars, in these same accidents, appear in the fourth group of column 3. Where both vehicles are of the same class, the casualties refer to those deriving from both vehicles, e.g. 56 accidents involved two pedal cycles with 71 cyclist casualties with 1 pedestrian first hit by one or other pedal cycle.

Column 11 shows the total number of two vehicle accidents for the vehicle class defined on the left (under vehicle A).

Column 12 includes all accidents involving 3 or more vehicles, at least one of which is of the class on the left (under vehicle A), together with casualties associated with that class in such accidents; e.g. 507 such accidents involved at least one pedal cycle, with 532 cyclist casualties and no pedestrians involved. Other casualties in these accidents would appear against the other vehicle classes concerned.

Column 13 is the sum of columns 1, 2, 11, and 12. In multi-vehicle accidents, the accidents (but not casualties) are multi-counted; e.g. the total number of accidents involving goods vehicles is 14,790 light goods vehicles (LGV) and 10,466 heavy goods vehicles (HGV) less the 424 accidents which involved both an HGV and a LGV and less any of the 3 or more vehicle accidents which involved at least one of each.

**Table 25.** The table gives the number of casualties in accidents involving different types of vehicle. As a large proportion of accidents involve two or more vehicles, not necessarily of the same type, many casualties will be counted in two or more columns of this table. Pedestrian casualties are included under each type of vehicle involved in the accident. For example (first row, under the heading "Car"), 457 road users were killed in accidents on built-up A roads in which a car was involved.

**Table 26.** The casualty rates, for a particular type of vehicle, have been calculated by dividing the number of user or pedestrian casualties by the total amount of traffic estimated for the particular type of vehicle on a particular class of road.

**Table 27.** This table shows the number of casualties in fatal, serious, and slight accidents for each of the road user types listed and these are further split by drivers or riders and passengers.

**Table 28.** Casualty rates are calculated by dividing the number of casualties of each road user type by the total number of vehicle kilometres travelled by that vehicle type each month. In calculating rates, no allowance has been made for the number of persons per vehicle, which may vary from month to month.

The table shows separate monthly casualties in respect of motorcycles and passenger car users as distinct from the remainder of the "car" category. Monthly rates are only possible for the groups shown.

**Table 33.** A "zebra" crossing has broad black and white stripes on the road and orange flashing beacons. A "pelican" or "puffin" crossing has lights controlling the traffic including a flashing amber phase, and lights controlling pedestrians (or pedestrians and cyclist/horse riders) including a flashing "green man" phase. This category also includes any crossing with traffic lights which is not a pelican/puffin/toucan crossing but which has an indicator light for pedestrians only. "Light controlled junction (with pedestrian phase)" is any crossing with traffic lights at a junction, with a "green man phase" or other indicator light for pedestrians, this does not include normal traffic signals with pedestrian stud crossing points but no special indicator lights for pedestrians. Crossings with "human

control” are those controlled by school crossing (“lollipop”) patrols and other authorised persons (police, traffic wardens).

**Tables 37 and 39.** See note to table 11 for the coverage of breath test data. The small number of breath tests which have been recorded as carried out on pedal cyclists and drivers of non motor vehicles have been excluded.

**Table 40.** This table shows the number of vehicles involved in fatal, serious, and slight accidents and data for other vehicles (ie taxis and minibuses) that usually come within the definition of a “car” in this publication.

**Table 42.** Although a few pedal cycles were reported as having been involved in accidents on motorways (see Table 41), no attempt is made to estimate cycle traffic on motorways nor to calculate corresponding rates. In other cells of the table, the rates are subject to uncertainty because of the small number of involvements (see Table 41) and because the traffic estimates are based on a small number of counting points.

**Table 44.** “Skidded” does not include vehicles which also jack-knifed. A vehicle which, as a result of the accident, was at any time on its roof, side, front or rear is recorded as having overturned, even though it may have come to rest on its wheels.

**Table 45.** In all cases the manoeuvres are those being performed immediately before the accident. For definition of “at a junction” see note to Table 19.

**Table 46.** Revised 1994-98 baseline figures have been agreed with a number of local authorities, where they have been able to demonstrate that the averages shown above are not an accurate reflection of their casualty numbers over the period. The revised baselines are used by DfT to monitor local highway authority progress against the casualty reduction targets. The figures shown are the actual figures held by DfT, not the revised baselines.

**Table 50.** This table compares the number of registered road deaths (as published by the Registrars General) with all accidental deaths and with deaths from all causes (both of which include registered road deaths). Road deaths published by the Registrars General are based on the date of death as opposed to the date of death registration. They differ from the STATS19 figures that are restricted to deaths within 30 days of an accident. Year to year fluctuations occur due to time lags between accident and death and registration of death.

**Table 51.** Due to lack of available traffic data for the majority of the countries, fatality rates per billion vehicle kilometres are not shown in this years data.

**Table 52.** There have been a number of small revisions to this table but these have had little effect on the comparisons of the different modes.

The air passenger casualty rates for 1999 have been revised following notification from the Civil Aviation Authority of a downward revision to the air casualties in that year. For rail, changes in reporting regulations mean that serious and minor injuries are no longer collected; only casualties taken from the scene of the accident to hospital are included in these figures.

Passenger casualty rates given in the table can be interpreted as the risk a traveller runs of being injured, per billion kilometres travelled. The coverage varies for each mode of travel and the definitions of injuries and accidents are different. Thus care should be exercised in drawing comparisons between the rates for different modes.

The table provides information on passenger casualties and where possible travel by drivers and other crew in the course of their work has been excluded. Exceptions are for private journeys and those in company owned cars and vans where drivers are included. Figures for all modes of transport exclude confirmed suicides and deaths through natural causes. Figures for air, rail and water exclude

trespassers and rail excludes attempted suicides. Accidents occurring in airports, seaports and railway stations that do not directly involve the mode of transport concerned are also excluded; for example, injuries sustained on escalators or falling over packages on platforms.

The following definitions are used:

**Air:** Accidents involving UK registered airline aircraft in UK and foreign airspace. Fixed wing and rotary wing aircraft are included but air taxis are excluded. Accidents cover UK airline aircraft around the world not just in the UK.

**Rail:** Train accidents and accidents occurring through movement of railway vehicles in Great Britain. As well as national rail the figures include accidents on underground and tram systems, Eurotunnel and minor railways.

**Water:** Figures for travel by water include both domestic and international passenger carrying services of UK registered merchant vessels.

**Road:** Figures refer to Great Britain and include accidents occurring on the public highway (including footways) in which at least one road vehicle or a vehicle in collision with a pedestrian is involved and which becomes known to the police within 30 days of its occurrence. Figures include both public and private transport. More information and analyses on road accidents and casualties can be found in Part 4: Road traffic, freight, accidents and motor vehicle offences.

**Bus or coach:** Figures for work buses are included.

**Car:** Includes taxis, invalid tricycles, three and four wheel cars and minibuses. Prior to 1999 motor caravans were also included.

**Van:** Vans mainly include vehicles of the van type constructed on a car chassis. These are defined as those vehicles not over 3.5 tonnes maximum permissible gross vehicle weight.

**Motorcycles:** Mopeds, motor scooters and two-wheeled motor vehicles (including motor cycle combinations).

**Pedal cycle:** Includes tandems, tricycles and toy cycles ridden on the carriageway.

**Pedestrian:** Includes persons riding toy cycles on the footway, persons pushing bicycles, pushing or pulling other vehicles or operating pedestrian controlled vehicles, those leading or herding animals, occupants of prams or wheelchairs, and people who alight safely from vehicles and are subsequently injured.

**Table 53.** This new table shows the number of foreign registered vehicles, the number of accidents involving these vehicles and casualties arising from these accidents. Where vehicles types are specified, only the foreign registered vehicle categories relevant to that vehicle type are included (e.g. Motorcycles erroneously coded as "foreign registered – left hand drive" will not be included in the Motorcycles rows). However, in the Other vehicles and All vehicles rows, all foreign registered vehicles are included, regardless of whether the foreign registration category is a valid match for the vehicle type.

## Definitions, symbols and conventions

*Accident*: Involves personal injury occurring on the public highway (including footways) in which at least one road *vehicle* or a *vehicle* in collision with a *pedestrian* is involved and which becomes known to the police within 30 days of its occurrence. The *vehicle* need not be moving and accidents involving stationary vehicles and pedestrians or users are included. One accident may give rise to several *casualties*. "Damage-only" accidents are not included in this publication.

*Adults*: Persons aged 16 years and over (except where otherwise stated).

*Agricultural vehicles*: Mainly comprises agricultural tractors (whether or not towing) but also includes mobile excavators and front dumpers.

*Built-up roads*: *Accidents* on "built-up roads" are those which occur on roads with *speed limits* (ignoring temporary limits) of 40 mph or less. "Non built-up roads" refer to speed limits over 40 mph. *Motorway accidents* are shown separately and are excluded from the totals for built-up and non built-up roads.

*Buses and coaches*: Buses or coaches equipped to carry 17 or more passengers, regardless of use.

*Cars*: Includes *taxis*, estate cars, three and four wheel cars and minibuses except where otherwise stated (i.e. Tables 22, 27, 28, and 40). Also includes motor caravans prior to 1999.

*Casualty*: A person *killed* or *injured* in an *accident*. Casualties are sub-divided into *killed*, *seriously injured* and *slightly injured*.

*Children*: Persons under 16 years of age (except where otherwise stated).

*Darkness*: From half an hour after sunset to half an hour before sunrise, i.e. "lighting-up time".

*Daylight*: All times other than *darkness*.

*DfT*: Department for Transport

*Drivers*: Persons in control of *vehicles* other than *pedal cycles*, *motorcycles* and ridden animals (see *riders*). Other occupants of *vehicles* are *passengers*.

*Failed breath test*: *Drivers* or *riders* who were tested with a positive result, or who failed or refused to provide a specimen of breath (see note on Table 11 in "Notes to individual tables" for the coverage of breath test data).

*Fatal accident*: An accident in which at least one person is *killed*.

*Goods vehicles*: These are divided into two groups according to vehicle weight. They include tankers, tractor units travelling without their semi-trailers, trailers, articulated vehicles and pick-up trucks.

*Heavy goods vehicles (HGV)*: Goods vehicles over 3.5 tonnes maximum permissible gross vehicle weight (gvw).

*Light goods vehicles (LGV)*: Goods vehicles, mainly vans (including car derived vans), not over 3.5 tonnes maximum permissible gross vehicle weight.

*Injury accident:* An *accident* involving human injury or death.

*Killed:* Human casualties who sustained injuries which caused death less than 30 days (before 1954, about two months) after the *accident*. Confirmed suicides are excluded.

*KSI:* Killed or seriously injured.

*Light Goods Vehicle (LGV):* see *Goods vehicles*

*Motorcycles:* Two-wheel motor vehicles, including mopeds, motor scooters and motor cycle combinations.

*Motorways:* Motorway and A(M) roads.

*Other roads:* All C class and unclassified roads (unless otherwise noted).

*Other vehicles:* Other motor *vehicles* include ambulances, fire engines, trams, refuse *vehicles*, road rollers, *agricultural vehicles*, excavators, mobile cranes, electric scooters and motorised wheelchairs etc, except where otherwise stated (i.e. Table 28). Other non motor *vehicles* include those drawn by an animal, ridden horses, wheelchairs without a motor, street barrows etc, except where otherwise stated (i.e. Table 28). In certain tables “*other vehicles*” may also include *buses and coaches* and/or *goods vehicles*, as indicated in a footnote.

*Passengers:* Occupants of *vehicles*, other than the person in control (the *driver* or *rider*). Includes pillion passengers.

*Pedal cycles:* Includes tandems, tricycles and toy cycles ridden on the carriageway. From 1983 the definition includes a small number of cycles and tricycles with battery assistance with a maximum speed of 15 mph.

*Pedal cyclists:* Riders of *pedal cycles*, including any *passengers*.

*Pedestrians:* Includes children riding toy cycles on the footway, persons pushing bicycles, pushing or pulling other *vehicles* or operating pedestrian-controlled *vehicles*, those leading or herding animals, children in prams or buggies, and people who alight safely from *vehicles* and are subsequently injured.

*Riders:* Persons in control of *pedal cycles*, *motorcycles* or ridden animals. Other occupants of these *vehicles* are *passengers*.

*Road users:* Pedestrians and vehicle riders, drivers and passengers.

*Rural Roads:* Major roads and minor roads outside urban areas and having a population of less than 10 thousand. *Motorways* in rural areas are shown separately and (with the exception of Tables 23a, b and c) are excluded from the totals for rural roads.

*Serious accident:* One in which at least one person is seriously injured but no person (other than a confirmed suicide) is *killed*.

*Serious injury:* An injury for which a person is detained in hospital as an “in-patient”, or any of the following injuries whether or not they are detained in hospital: fractures, concussion, internal injuries, crushings, burns (excluding friction burns), severe cuts, severe general shock requiring medical treatment and injuries causing death 30 or more days after the *accident*. An injured *casualty* is recorded as *seriously* or *slightly injured* by the police on the basis of

information available within a short time of the *accident*. This generally will not reflect the results of a medical examination, but may be influenced according to whether the casualty is hospitalised or not. Hospitalisation procedures will vary regionally.

*Severity*: Of an *accident*; the severity of the most severely injured *casualty* (either *fatal*, *serious* or *slight*). Of a *casualty*; *killed*, *seriously injured* or *slightly injured*.

*Slight accident*: One in which at least one person is *slightly injured* but no person is *killed* or *seriously injured*.

*Slight injury*: An injury of a minor character such as a sprain (including neck whiplash injury), bruise or cut which are not judged to be severe, or slight shock requiring roadside attention. This definition includes injuries not requiring medical treatment.

*Speed limits*: Permanent speed limits applicable to the roadway.

*Taxi*: Any vehicle operating as a hackney carriage, regardless of construction, and bearing the appropriate district council or local authority hackney carriage plates. Also includes private hire cars.

*Users of a vehicle*: All occupants, i.e. *driver* (or *rider*) and *passengers*, including persons injured while boarding or alighting from the *vehicle*.

*Urban Roads*: Major and minor roads within an urban area with a population of 10 thousand or more. The definition is based on the 1991 Office of the Deputy Prime Minister definition of urban settlements. The urban areas used for this bulletin are based on 2001 census data. *Motorways* in urban areas are shown separately and (with the exception of Tables 23a, b and c) are excluded from the totals for urban roads.

*Vehicles*: Vehicles (except *taxis*) are classified according to their structural type and not according to their employment or category of licence at the time of an *accident*.

*Vehicles involved in accidents*: *Vehicles* whose *drivers* or *passengers* are injured, which hit and injure a *pedestrian* or another *vehicle* whose *driver* or *passengers* are injured, or which contribute to the *accident*. *Vehicles* which collide, after the initial *accident* which caused injury, are not included unless they aggravate the degree of injury or lead to further *casualties*. Includes *pedal cycles* ridden on the footway.

## **Symbols and conventions used**

*Rounding of figures*: In tables where figures have been rounded, there may be an apparent slight discrepancy between the sum of the constituent items and the total as shown.

*Symbols*: The following symbols have been used throughout:

0 = nil or negligible (less than half the final digit shown).

.. = not available/applicable.

*Conversion factor*: 1 kilometre = 0.6214 mile.

2004	58.1	32.3	1,073	717	207	671	134	585	1,831	3,221	278	281
2005	58.5	32.8	1,075	719	199	671	148	569	1,813	3,201	268	271
2006	58.8	33.4	1,090	729	189	675	146	599	1,752	3,172	255	258

Note: Road accident and casualty data was first collect on a national level in 1926. That year there were 4,886 recorded deaths in some 124,000 accidents. The highest record road death figure was 9,196 in 1941, the highest post WW2 fatality figure was 7,985 in 1966

- 1 Traffic estimates for 1995 onwards have been produced on a new, more accurate basis and are not directly comparable with earlier data.
- 2 Between 1937 and 1977 the figures excluded sidecar passengers and second riders of tandems
- 3 Includes cases where road user type was not reported
- 4 Population figures have been revised by ONS so there is a break in the series at this point

### 3 Accidents and accident rates: by road class and severity<sup>1</sup>: 1994-98 average, 1999 - 2006

1 Involves multiple-counting if more than one vehicle type present. Pedestrian casualties are included with all casualties in accidents involving each specific type of vehicle.

2 Includes motorcycle combinations and scooters.

3 Includes other motor vehicles.

4 Includes other non motor vehicles and cases where vehicle type was not reported.

5 Excludes motorways.

6 Killed or seriously injured.

7 Includes cases where road class was not reported.

8 Includes cases where speed limit was not reported.

## 26 Casualty and accident rates: by urban and rural roads, road class, road user type, severity and pedestrian involvement: 2006

Rate per 100 million vehicle kilometres

	Urban roads <sup>1</sup>			Rural roads <sup>1</sup>			All roads

1 Source: International Road Traffic and Accident Database (OECD), ITF, EUROSTAT and CARE (EU road accidents database).

2 In accordance with the commonly agreed international definition, most countries define a fatality as one being due to a road accident where death occurs within 30 days of the accident. The official road accident statistics of some countries however, limit the fatalities to those occurring within shorter periods after the accident. Numbers of deaths and death rates in the above table have been adjusted according to the factors used by the Economic Commission for Europe and the International Transport Forum (ITF) (formerly known as ECMT) to represent standardised 30-day deaths: Italy (7 days) +8%; France (6 days) +5.7%; Portugal (1 day) +14%; Republic of Korea (3 days) +15%.

3 All motor vehicles excluding mopeds/mofas.

Note: KSI = Killed or seriously injured.  
All = Killed, seriously and slightly injured.

1 Figures have been revised from those published in previous years, see Notes and Definitions for more details.

2 Passenger casualties in accidents involving UK registered airline aircraft in UK and foreign airspace.

3 Financial years.

4 Passenger casualties involved in train accidents and accidents occurring through movement of railway vehicles. Reporting regulations changed on 1 April 1996. Since then figures are only available for passenger fatalities and injuries. The reporting trigger for an injury is the passenger being taken to hospital directly from the scene.

5 Passenger casualties on UK registered merchant vessels.

6 Driver and passenger casualties.

7 Figures for 2000 to 2003 have been revised to be on a calendar year basis.

### 53 Accidents, vehicles and casualties: by vehicle type and foreign registration: 2006

1 Killed or seriously injured.

2 Includes motorcycle combinations, motor scooters and mopeds.

3 Left hand drive.

4 Right hand drive.

5 Includes other motor and non motor vehicles and cases where vehicle type was unknown.

6 Includes cases where there is conflicting data (eg. Motorcycles coded as "left hand drive").

7 Includes pedal cycles.

## Calendar of events affecting road safety and traffic

**1903–1904:** Motor Car Act introduced driving licences. Vehicle braking requirements are introduced for the first time.

**1927:** First automatic traffic light signals installed.

**1930:** Speed limit of 20 mph is abolished for cars and cycles. PSVs are limited to 30 mph and maximum working hours for PSV and goods vehicle drivers are introduced. Testing for some driving licences is made compulsory. Third party insurance cover becomes necessary. Minimum driving age set.

**1931:** Highway Code first issued.

**1934–1935:** In built-up areas a speed limit of 30 mph is made compulsory. HGV licences are introduced. The first pedestrian crossings appear. Regulations concerning vehicle safety glass and windscreen wipers are introduced. Invention of “cats eyes” reflecting road studs. Compulsory driving tests introduced as part of the Road Traffic Act. “L” plates introduced.

**1939–1945:** Signposts removed during wartime. Driving tests are suspended with examiners designated as Traffic Officers, supervising fuel rationing.

**1946–1948:** Wartime lighting restrictions are relaxed and driving tests restored in 1946. Petrol allowance of 180 miles per month is permitted.

**1949–1954:** New anti-dazzle regulations are introduced. Legislation concerning new lighting and school crossing patrols are introduced. Flashing indicators on motor vehicles are legalised. Brakes on pedal cycles are made compulsory. Introduction of zebra crossings. New Highway Code features first colour illustrations.

**1955–1957:** Regulations concerning parking without lights in London are introduced. The maximum length allowed for vehicles is increased. Holders of lapsed licences issued over 10 years previously must retake driving test to obtain a new licence. Penalties for drinking and driving are extended to pedal cyclists. Fuel shortages resulting from the Suez crisis in 1956 decrease motor traffic; driving tests are suspended during the crisis. First motorway opened.

**1959–1960:** Motorway regulations, new vehicle lighting regulations and double white lines are introduced. Speed limit of 40 mph introduced for some roads. Learner motorcyclists are restricted to riding machines of under 250 cc. Annual testing of 10 year old cars and LGVs is introduced. Introduction of parking meters on London streets. Yellow lines denoting waiting restrictions introduced. Stanmore examiner training school opened.

**1961–1963:** Testing of all vehicles of 30 cwt and under and more than 7 years old is made compulsory. A valid test certificate is required to obtain a vehicle licence. Free copies of the Highway Code are circulated. TV car safety campaign *You Know It Makes Sense* launched, encouraging use of seatbelts. Motorcyclists permitted to ride bikes over 250cc (after passing their test) under the Road Traffic Act 1962.

**1964–1965:** Introduction of trial speed limit of 70 mph on motorways and other previously derestricted roads. First “Drink and Drive” publicity campaign. Voluntary registration scheme for driving instructors is introduced. Introduction of the present European style of symbolic traffic signs.

**1966–1967:** Rule introduced requiring traffic entering a roundabout to give way to traffic already on it. Motorway warning signals introduced following accidents in fog. Seat belt fitting is made compulsory

for new cars. It becomes an offence to drive with over 80mg of alcohol per 100ml of blood. Breath tests introduced. Permanent maximum speed limit of 70 mph introduced for previously unrestricted roads. HGVs banned from the outside lane of motorways.

**1968–1969:** Introduction of plating and testing of goods vehicles and voluntary HGV driving tests – Regulations on drivers' working hours are introduced. Test certificate now required for cars more than 3 years old. Pelican crossings are introduced. Fatal level crossing accident results in new signs and safety procedures. First UK bus lane introduced in Park Lane, London.

**1970–1972:** HGV driving test and registration of driving instructors becomes compulsory. 16 year olds are limited to riding mopeds only. Rear markings and long vehicle signs are made compulsory for HGVs. Zig-zag markings introduced at zebra crossings. Child seatbelt TV campaign *Your Seatbelt is their Security* is launched in 1970. The following year sees the introduction of the *Clunk Click Every Trip* seatbelt campaign. The Green Cross Code is launched to promote child pedestrian safety, aimed specifically at children themselves.

**1973–1974:** Safety helmets are made compulsory for two-wheeled motor vehicle users. Energy crisis leads to petrol shortages and large fuel price increases and to temporary 50 mph national maximum speed limit.

**1975–1976:** Vehicles now required to be lit when daylight visibility is seriously reduced. Minimum age of trainee HGV drivers reduced to 18. Abolition of front number plates on TWMVs. Mini-roundabouts introduced.

**1977:** Mopeds redefined to 30 mph maximum design speed. MOT test widened to include windscreen wipers and washers and exhaust systems. 1977 Christmas drink drive campaign slogan *Think before you drink before you drive* is used by the Brewers and Licensed Retailers Association in later education campaigns.

**1978:** 60 and 70 mph speed limits are made permanent. New rules on the maximum number of hours that may be worked by goods vehicle drivers are introduced. High intensity rear fog lamps become a mandatory fitment to most vehicles manufactured after 1 October 1979 and used from 1 April 1980.

**1979:** Regulations are introduced to help prevent lorries hitting overhead bridges. Code of practice issued on vehicle safety defects (arrangements for recall on new vehicles found to be defective). Use of tachograph accepted by Government. Start of long-term drink/driving tracking research.

**1980–1981:** Reform of bus licensing and removal of advertising restrictions from private car sharing schemes. Reduction in minimum driving age of invalid car drivers to 16.

**1982:** Two part motorcycle test introduced. Provisional motorcycle licences restricted to two years. Recall code announced for manufacturers to recall potentially defective motorcycles. Tougher written examination for entrants to driving instructor registration scheme.

**1983:** Seat belt wearing becomes law for drivers and front seat passengers. Learner motorcyclists now only allowed to ride machines of up to 125 cc. First road hump regulations made.

**1984:** Stiffer driving tests for entrants of driving instructor registration scheme. Tougher internal checks on tuition given by qualified driving instructors. New pedal cycles are required to meet British Standards. Revised Code of Practice on safety of loads on vehicles is issued. Spray reducing devices required to be fitted to lorries and trailers.

**1985:** Both load and speed performance to be marked on new car tyres. Regulations allowing the use of traffic cones, warning lamps, and triangles in the event of breakdowns come into force. New

safety package (improved audible and visual warnings and minimum pavement widths) for pedestrians at modernised level crossings. PSV driving tests made compulsory.

**1986:** Uniform construction standards to apply to minibuses first used from April 1988. Tyres are now required to support maximum axle weights at a vehicle's maximum speed. Seat belt legislation is made permanent. White on brown signs to tourist attractions introduced. European Road Safety Year.

**1987:** The Secretary of State for Transport sets a target to achieve a one third reduction in road accident casualties by the year 2000. All newly registered cars to be fitted with rear seat belts or child restraints. Use of amber flashing lights on slow moving vehicles is made compulsory. Zig-zag markings extended to Pelican crossings. Closure of 586 emergency crossing points on central reservations of motorways.

**1988:** Close proximity and wide angle rear view mirrors become a legal requirement on new HGVs. All new cars first used from 1 April must be able to use unleaded petrol. All coaches first used from 1 April 1974 must have 70 mph limiters fitted by 1 April 1992. Driving tests hereafter conducted under the provisions of the Road Traffic Act 1988.

**1989:** Penalty points increased for careless driving, driving without insurance, and failing to stop after or to report an accident. Accompanied motorcycle testing becomes mandatory. Seat belt wearing by rear child passengers becomes law in cars where appropriate restraints have been fitted and are available. The Booth Report published, assessing motorcycle accidents in the Metropolitan Police area. Motorcycle test revised to include radio contact and accompaniment by examiner.

**1990:** Compulsory basic training for motorcyclists introduced. Learner motorcyclists banned from carrying pillion passengers. New road hump regulations. High Risk Offenders Scheme for problem drink-drivers extended; introduction of charges for medical examination required before return of licence. New regulations require those accompanying learner drivers to be at least 21 years old and to have held a licence for 3 years. Experimental Red Routes introduced in London.

**1991:** First 20mph zones introduced. Chevron markings introduced on the M1 to help drivers keep a safe distance from the vehicle in front. First trials of nearside pedestrian signal at junctions. First edition of *Car and Driver: Injury Accident and Casualty Rates* published giving information on comparative accident involvement and injury risks of popular makes and models of car. Seat belt wearing by rear adult passengers becomes law in cars where belts are fitted and available.

**1992:** Requirement for a minimum tread depth of 1.6mm introduced for cars and light vans. Traffic Calming Act 1992 receives Royal Assent. Launch of road safety campaign *Kill Your Speed, Not A Child*. Government issues *Killing Speed and Saving Lives* consultation paper. Safety helmets made compulsory for child horse riders. Speed enforcement cameras and retesting of dangerous drivers introduced. All new goods vehicles over 7.5 tonnes fitted with 60 mph speed limiters. New emission requirements made 3-way catalytic converters necessary on virtually all new petrol-engined cars.

**1993:** Experimental scheme begins in the use of rehabilitation courses for drink/drive offenders. MOT test for cars extended to include checks on mirrors, fuel tanks and pipes, body security, seat and door security, additional lighting items, number plates and windscreen condition. Consolidation of seat belt wearing regulations. Bus Advance Areas introduced. Traffic Calming Regulations enable highway authorities to introduce a wider range of traffic calming features.

**1994:** Publication of *Safer by Design* brochure produced for local councils to encourage traffic calming. London Boroughs take over most parking enforcement in the capital. 100th speed camera site established and 100th 20mph speed limit zone opened. Launch of *Elephant* rear seat belt and *Kill Your Speed* TV publicity campaigns. Major revision of traffic signs regulations introducing modified system of colour coded direction signs, simplification of yellow line system of waiting

restrictions and a range of new warning and regulatory signs. Speed limiter settings lowered to 65 mph for new buses and coaches and to 56 mph for HGVs.

**1995:** Publication of *Road Safety Report 1995*. Pass Plus scheme introduced for new drivers, which encourages new drivers to take more lessons by offering discount on motor insurance. New edition of the Highway Code for young road users. Speed campaign *Don't Look Now* incorporates radio commercials for the first time. New edition of *Choosing Safety* booklet published, giving advice on car safety and security features.

**1996:** Driving theory test introduced for car and motorcycle learners (1 July). Latest *Kill Your Speed* campaign focuses on children killed near their homes using emotive music, poetry and relatives voices. *Child Pedestrian Safety in the UK* published. Publication of advice booklets on the forthcoming requirement for seat belts in minibuses and coaches carrying children. Publication of consultation document *Targeting the Future* which sets out options for post 2000 casualty targets.

**1997:** New Zebra, Pelican and Puffin crossing regulations introduced. Road Traffic (New Drivers) Act 1995 comes into force; withdrawal of licence and compulsory retesting for new drivers who accumulate 6 or more penalty points within 2 years of passing their driving test. Written theory test introduced for LGV and PCV drivers.

**1998:** Transport white paper *A New Deal for Transport: Better for Everyone* published, promoting public transport and safer, more secure transport systems. Drink-drive rehabilitation experiment expanded to cover around one-third of courts in Great Britain and extended for 2 years to the end of 1999. Publication of *Combating Drink-drive: Next Steps* consultation paper.

**1999:** *Kill your Speed* campaign launched (six weeks: £3.5m). GLA Road Network announced (220 miles of trunk roads and 105 miles of borough roads). *Cycle Smart* campaign for child cyclists launched. First BBC simulcast commercial for £2.6m Millennium Drink-Drive campaign. Changes to practical driving test introduced.

**2000:** The government announced a new road safety strategy and casualty reduction targets for the year 2010 in *Tomorrows Roads – Safer for Everyone*. A review of speed policy was conducted and reported in *New Directions in Speed Management*. £1.4bn targeted programme of improvements announced in *A New Deal for Trunk Roads in England* following the Roads Review. National Cycle Network officially opened. *Think!* road safety campaign launched.

**2001:** The government announced a £10 million pilot of road safety schemes for children in deprived areas. *Road Safety Good Practice Guidance* published. First national campaign launched for fitting child car seats correctly. "Hedgehogs" road safety website launched for children.

**2002:** The government seeks views on banning mobile phones whilst driving. £6 million was made available to improve road safety in most deprived cities. A new motorcycle safety campaign is launched, as is a campaign urging parents to check their child's car seat every trip. *Dangerous driving and the Law* report published.

**2003:** The phased introduction of the hazard perception test into the theory test was completed. As of 1 December the new offence of using a hand held mobile phone while driving is introduced. *Seatbelt campaign THINK! Wear a seatbelt....You don't get a second chance* features an online interactive crash simulator. Radio drink driving campaign timed to coincide with early morning pub opening during Rugby Union World Cup. Congestion Charging introduced in London.

**2004:** The first three year review of the Government's road safety strategy published. The World Health Organisation dedicated World Health Day to the issue of road safety. The United Nations issued a resolution on global road safety

**2005:** Roads Policing Strategy published jointly by Dept for Transport, Home Office and Association of Chief Police Officers. Publication of Government's Motorcycling Strategy, recognising motorcycling as a "mainstream" mode of transport. Evidential roadside breath testing enabled by the Serious Organised Crime and Police Act 2005. *Distractions* campaign, aimed at teenage pedestrians, features *Camera Phone*, first TV commercial shot entirely on a mobile video phone.

**2006:** Road Safety Act passed. The act made provision for a wide range of road safety matters including: drink driving, speeding, driver training and driver and vehicle licensing.

## Review topics 1951–2005

Subject	Year of publication
ABI “snapshot” of motor insurance claims	1990
Accident rates	1963
Accidents and accident risk to different classes of road user	1968
Accident histories by birth cohort	1986
Accidents on the London to Birmingham motorway	1960
Accident severity	1955, 1966
A new method of identifying Urban and Rural Roads	2002
Area road safety units	1963
Best and worst days for accidents	1987
Bicycles – see pedal cycles	
British Standard Time	1968, 1971
Buses (PSVs)	1968, 1975–1976, 1990
Cars	1968
Casualties by age	1955, 1964–1966
Casualties boarding and alighting from buses and coaches	1983
Casualties to children	1956, 1989
Casualty rates	1963–1966
Casualties on public holidays	1985
Casualty rates by age and sex	1980, 1987
Casualty reduction targets	2000
Casualty seasonality at specified hours	1985
Casualty severity	1966, 1990
Changes to Definitions and Tables for 1999 as a result of the 1997 Quinquennial Review	1999
Changes to Definitions and Tables as a result of the 2002/03 review of road accident statistics	2005
Child pedestrian cohorts	1982
Child pedestrian safety	1993
Child seat belt wearing	1986, 1989
Children’s Traffic Club (Effects of)	1994
Coach speed survey	1984, 1986
Cohort analysis	1981
Collection, collation and analysis of personal injury accident data	1991, 1996
Comparison of casualties in 1958 and 1981	1981
Comparison of two wheeled motor vehicle and car accidents	1985
Comparisons with other European Community countries	1987
Compulsory seat belt wearing	1984
Construction and use regulations for motor vehicles	1963–1964
Contributory Factors to Accidents	2004
Costs of accidents	1968–1991, 1993, 1995–1996
Costing road accidents in Great Britain	1991
Crash helmets	1956
Crossover accidents	1983
Cuts in street lighting	1974
Daylight and darkness	1955
Drinking and driving	1968–1973, 1975, 1977–1980, 1983–2005
Drink and drive campaign	1964
Driver training	1969
Drivers and their passengers	1953–1956, 1960–1963, 1992
Driving standards	1969
Early road accident investigation: 1909–1933	1990
Effect of traffic on accidents	1956
Effects of rail/tube strikes and fare changes	1982–1983
Elderly casualties	1988
European road safety year	1985
Experimental road safety measures	1964

Experimental speed limits	1960–1964
Factors contributing to accidents	1952, 1954–1955
Fatal road accidents and loss of life expectancy	1991
Faults of drivers	1954
Fires in road vehicles	1982, 1986
Fog on motorways	1971, 1976
Forty years on	1991
Fuel crises and temporary speed limits	1975
General review	1951–1956, 1959–2005
Goods vehicles	1968, 1971–1972, 1974–1975, 1979, 1981
Heavy goods vehicles	1982
High Risk Offenders, June 1990–February 1993	1992
Historic cost of road accidents	1987
Hit and run accidents	1984, 1989, 1994
How many of us will die in road accidents?	1986
If you double your mileage, do you double your accident risk?	1991
Impact of large motorway accidents	1985
Impact of speed cameras on road casualties	2000
Importance of accident data to local authorities	1990
Insurance claims statistics <sup>3</sup>	1985, 1987–1995
International road accident statistics	1982
Invalid tricycles	1974–1975, 1977
Involvement of alcohol in fatal accidents to adult pedestrians	1991
Involvement of Horses in road accidents	2002
Involvement rates by age and sex	1981
Involvement rates by road class	1979
Lighting and accidents	1984, 1988
Local authority road safety committees	1961–1964
Location of accidents	1960–1962, 1966
Long term trends	1968, 1993
Major British Road Accidents 1946–1994	1994
Manoeuvres	1956–1966
Mind that child campaign	1956
Mopeds and motorcycles (also see Two wheel motor vehicles)	1953–1956, 1959–1963, 1982–1983
Motorcycle casualties and accidents	1985–1986, 1988
Motorway accidents	1972–1973, 1984
Motorway accidents in the presence of road works	1985
Motorway safety: general	1987
Motorway safety: international comparisons	1986
National cycling proficiency scheme	1961–1964, 1969
National Hospital Study of Road Accident Casualties	1996
Nature of accidents	1966
Nature of injuries	1980–1981, 1985–1986
New traffic signs	1964
Offences relating to motor vehicles	1973
Panda crossings	1963–1964
Parking without lights	1972
Peak times for casualties	1959–1963
Pedal cycles	1953–1956, 1959–1963, 1968, 1978–1979, 1981, 1983–1984, 1989
Pedestrian casualties	1987, 1989
Pedestrian crossings	1953–1955, 1963–1964
Pedestrians and pedestrian safety	1959–1963, 1968, 1970–1972, 1974–1978, 1980, 1984, 1993
Penalty system for motoring offences	1963
Pedestrian casualties: comparisons with Japan and the Netherlands	1985

Prevention of accidents	1969
Prospect for the 1970s	1969
Public holiday casualties	1959–1963
Quinquennial review of the collection of road injury accident data (1992)	1992, 2001
RAC/Auto cycle union training scheme	1961–1963
Rear markings	1974
Revised road accident reports	1979
Revised traffic statistics	1983
Risks posed by vehicles to other road users	1990
Road accident Great Britain questionnaire	1994
Road accident trends since 1949	1963–1964
Road accident statistics in peace and war in Britain: 1930–1951	1991
Road casualties 1870 to 1910	1987
Road casualties versus rail	1982
Road safety activities	1961–1964
Road safety films	1961–1964
Road safety publicity	1961–1964, 1969, 1980–1987, 1993
Road Traffic Act (1962)	1962
Road works	1981
RoSPA	1961–1964
Scottish road accidents	1956, 1959
Seasonal adjustment of casualty numbers and rates	1981, 1986
Seasonal pattern of accidents and casualties	1980
Seat belts	1962, 1968, 1971–1975, 1979–1980, 1982–1985, 1989
Separation distances	1974–1975
Skidding	1956, 1990
Speed limits	1974–1975
Speed surveys	1975–1977, 1983, 1990
Teenage accidents	1982
Time to die after a road accident	1986
Timing of accidents	1966
Transport kills	1982
Trends since 1949	1963–1964
Trunk and principal roads	1982
Twenty years of road accidents (1934–1953)	1953
Two wheel motor vehicles (see also mopeds and motorcycles)	1968–1969, 1972–1979, 1984
Tyre regulations	1968
Uses of vehicle number plate data	1991
Valuation of the reduction in risk of road accidents	1992, 1994
Valuation of preventing fatal road accident casualties	1997
Vehicle age	1983
Vehicle Damage Survey	1974
Vehicle defects	1953, 1975
Vehicle involvement rates by road class	1985
Vehicle lighting regulations	1964
Vehicle testing	1961–1964
Vulnerable road users	1964–1965, 1968
Where casualties occur	1964–1965, 1968
Who gets hurt	1968
Who hits whom	1965
Young driver casualties	1992
Zebra crossings	1953–1955
50 mph speed limit experiments	1964

1.3 ACCIDENT REFERENCE

**\*FATAL / SERIOUS / SLIGHT**

1.9 TIME     DAY\*       1.7 DATE

1st Road Class & No.     or (Unclassified - UC) (Not Known - NK) 1st Road Name

Outside House No.     or Name or Marker Post No.     at junction with / or     metres     \* of

2nd Road Class & No.     or (Unclassified - UC) (Not Known - NK) 2nd Road Name

Town                      Sector /Beat No.

County or Borough                      1.10 Local Auth No. (if known)

1.11 Grid Reference                      E →           N ↑

REPORTING Name                      Number           OFFICER BCU/Stn     1.2 Force                      Tel Number

1.5 Number of vehicles

1.6 Number of casualties

1.14 ROAD TYPE

Roundabout	1	
One way street	2	
Dual carriageway	3	
Single carriageway	6	
Slip road	7	
Unknown	9	

1.15 Speed Limit (Permanent)

1.16 JUNCTION DETAIL

Not at or within 20 metres of junction	00	
Roundabout	01	
Mini roundabout	02	
T or staggered junction	03	
Slip road	05	
Crossroads	06	
Multiple junction	07	
Using private drive or entrance	08	
Other junction	09	

**JUNCTION ACCIDENTS ONLY**

1.17 JUNCTION CONTROL

Authorised person	1	
Automatic traffic signal	2	
Stop sign	3	
Give way or uncontrolled	4	

1.20a PEDESTRIAN CROSSING - HUMAN CONTROL

None within 50 metres	0	
Control by school crossing patrol	1	
Control by other authorised person	2	

1.20b PEDESTRIAN CROSSING - PHYSICAL FACILITIES

No physical crossing facility within 50m	0	
Zebra crossing	1	
Pelican, puffin, toucan or similar non-junction pedestrian light crossing	4	
Pedestrian phase at traffic signal junction	5	
Footbridge or subway	7	
Central refuge — no other controls	8	

1.22 WEATHER

Fine without high winds	1	
Raining without high winds	2	
Snowing without high winds	3	
Fine with high winds	4	
Raining with high winds	5	
Snowing with high winds	6	
Fog or mist — if hazard	7	
Other	8	
Unknown	9	

1.23 ROAD SURFACE CONDITION

Dry	1	
Wet / Damp	2	
Snow	3	
Frost / Ice	4	
Flood (surface water over 3cm deep)	5	

1.21 LIGHT CONDITIONS

Daylight: street lights present	1	
Daylight: no street lighting	2	
Daylight: street lighting unknown	3	
Darkness: street lights present and lit	4	
Darkness: street lights present but unlit	5	
Darkness: no street lighting	6	
Darkness: street lighting unknown	7	

1.24 SPECIAL CONDITIONS AT SITE

None	0	
Auto traffic signal out	1	
Auto traffic signal partially defective	2	
Permanent road signing or marking defective or obscured	3	
Roadworks	4	
Road surface defective	5	
Oil or diesel	6	
Mud	7	

1.25 CARRIAGEWAY HAZARDS

None	0	
Dislodged vehicle load in carriageway	1	
Other object in carriageway	2	
Involvement with previous accident	3	
Pedestrian in carriageway - not injured	6	
Any animal in carriageway (except ridden horse)	7	

1.26 Did a police officer attend the scene and obtain the details for this report?

Yes	1	
No	2

2.26 VEHICLE REGISTRATION MARK	
Vehicle 001	<input type="text"/>
Vehicle 002	<input type="text"/>
Vehicle 003	<input type="text"/>
Vehicle 004	<input type="text"/>

2.28 FOREIGN REGISTERED VEHICLE <input checked="" type="checkbox"/>	VEHICLE			
	1	2	3	4
Not foreign registered vehicle	0			
Foreign registered vehicle LHD	1			
Foreign registered vehicle RHD	2			
Foreign reg' vehicle-two wheeler	3			

2.5 TYPE OF VEHICLE <input checked="" type="checkbox"/>					
Pedal cycle	01				
M/cycle 50cc and under	02				
M/cycle over 50cc and up to 125cc	03				
M/cycle over 125cc and up to 500cc	04				
Motorcycle over 500cc	05				
Taxi / Private hire car	08				
Car	09				
Minibus (8-16 passenger seats)	10				
Bus or coach (17 or more passenger seats)	11				
Other motor vehicle	14				
Other non-motor vehicle	15				
Ridden horse	16				
Agricultural vehicle (include diggers etc)	17				
Tram / Light rail	18				
Goods vehicle 3.5 tonnes mgw and under	19				
Goods vehicle over 3.5 tonnes mgw and under 7.5 tonnes mgw	20				
Goods vehicle 7.5 tonnes mgw and over	21				

2.6 TOWING AND ARTICULATION <input checked="" type="checkbox"/>					
No tow or articulation	0				
Articulated vehicle	1				
Double or multiple trailer	2				
Caravan	3				
Single trailer	4				
Other tow	5				

2.21 SEX OF DRIVER <input checked="" type="checkbox"/>					
Male	1				
Female	2				
Driver not traced	3				

2.22 AGE OF DRIVER (Estimate if necessary)	
Vehicle 001	<input type="text"/>
Vehicle 002	<input type="text"/>
Vehicle 003	<input type="text"/>
Vehicle 004	<input type="text"/>

2.27 DRIVER HOME POSTCODE or Code: 1- Unknown 2- Non UK Resident 3 - Parked & unattended <input checked="" type="checkbox"/>	
Vehicle 001	<input type="text"/>
Vehicle 002	<input type="text"/>
Vehicle 003	<input type="text"/>
Vehicle 004	<input type="text"/>

2.23 BREATH TEST <input checked="" type="checkbox"/>	VEHICLE			
	1	2	3	4
Not applicable	0			
Positive	1			
Negative	2			
Not requested	3			
Refused to provide	4			
Driver not contacted at time of acc'	5			
Not provided (medical reasons)	6			

2.24 HIT AND RUN <input checked="" type="checkbox"/>					
Not hit and run	0				
Hit and run	1				
Non-stop vehicle, not hit	2				

2.29 JOURNEY PURPOSE OF DRIVER/RIDER <input checked="" type="checkbox"/>					
Journey as part of work	1				
Commuting to / from work	2				
Taking school pupil to/from school	3				
Pupil riding to / from school	4				
Other/Not known	5				

2.9 VEHICLE LOCATION AT TIME OF ACCIDENT RESTRICTED LANE/AWAY FROM MAIN C'WAY <input checked="" type="checkbox"/>					
On main carriageway not in restricted lane	00				
Tram / Light rail track	01				
Bus lane	02				
Busway (inc. guided busway)	03				
Cycle lane (on main carriageway)	04				
Cycleway or shared use footway (not part of main carriageway)	05				
On lay-by / hard shoulder	06				
Entering lay-by / hard shoulder	07				
Leaving lay-by / hard shoulder	08				
Footway (pavement)	09				

2.10 JUNCTION LOCATION OF VEHICLE <input checked="" type="checkbox"/>					
Not at or within 20m of junction	0				
Approaching junction or waiting /parked at junction approach	1				
Cleared junction or waiting/parked at junction exit	2				
Leaving roundabout	3				
Entering roundabout	4				
Leaving main road	5				
Entering main road	6				
Entering from slip road	7				
Mid junction- on roundabout or on main road	8				

2.7 MANOEUVRES <input checked="" type="checkbox"/>					
Reversing	01				
Parked	02				
Waiting to go ahead but held up	03				
Slowing or stopping	04				
Moving off	05				
U turn	06				
Turning left	07				
Waiting to turn left	08				
Turning right	09				
Waiting to turn right	10				
Changing lane to left	11				
Changing lane to right	12				
O'taking moving veh on its offside	13				
O'taking stationary veh on its offside	14				
Overtaking on nearside	15				
Going ahead left hand bend	16				
Going ahead right hand bend	17				
Going ahead other	18				

2.11 SKIDDING AND OVERTURNING <input checked="" type="checkbox"/>	VEHICLE			
	1	2	3	4
No skidding, jack-knifing or overturning	0			
Skidded	1			
Skidded and overturned	2			
Jack-knifed	3			
Jack-knifed and overturned	4			
Overturned	5			

2.12 HIT OBJECT IN CARRIAGEWAY <input checked="" type="checkbox"/>					
None	00				
Previous accident	01				
Roadworks	02				
Parked vehicle	04				
Bridge-roof	05				
Bridge-side	06				
Bollard / Refuge	07				
Open door of vehicle	08				
Central island of roundabout	09				
Kerb	10				
Other object	11				
Any animal (except ridden horse)	12				

2.13 VEHICLE LEAVING CARRIAGEWAY <input checked="" type="checkbox"/>					
Did not leave carriageway	0				
Left carriageway nearside	1				
Left carriageway nearside and rebounded	2				
Left carriageway straight ahead at junction	3				
Left carriageway offside onto central reservation	4				
Left carriageway offside onto central reserve and rebounded	5				
Left carriageway offside and crossed central reservation	6				
Left carriageway offside	7				
Left carriageway offside and rebounded	8				

2.14 FIRST OBJECT HIT OFF CARRIAGEWAY <input checked="" type="checkbox"/>					
None	00				
Road sign / Traffic signal	01				
Lamp post	02				
Telegraph pole / Electricity pole	03				
Tree	04				
Bus stop / Bus shelter	05				
Central crash barrier	06				
Nearside or offside crash barrier	07				
Submerged in water (completely)	08				
Entered ditch	09				
Other permanent object	10				

2.16 FIRST POINT OF IMPACT <input checked="" type="checkbox"/>					
Did not impact	0				
Front	1				
Back	2				
Offside	3				
Nearside	4				

2.17 FIRST CONTACT BETWEEN EACH VEHICLE Example: In a 3 car collision vehicle 1 collides with the rear of vehicle 2 pushing it into vehicle 3.	
Example Code:	
Vehicle 001 first collides with vehicle 002	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 002 first collides with vehicle 001	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 003 first collides with vehicle 002	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 001	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 002	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 003	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>
Vehicle 004	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>

Subject to local directions, boxes with a grey background need not be completed if already recorded

<p><b>2.8 DIRECTION OF VEHICLE TRAVEL</b></p> <p>1. Using the Example shown complete the FROM and TO boxes for the vehicles concerned, indicating direction of travel FROM and TO</p> <p>2. If PARKED enter '00'</p>	<p><b>Vehicle 001</b></p> <p>FROM <input type="text"/> TO <input type="text"/></p> <p><b>Vehicle 002</b></p> <p>FROM <input type="text"/> TO <input type="text"/></p> <p><b>Vehicle 003</b></p> <p>FROM <input type="text"/> TO <input type="text"/></p> <p><b>Vehicle 004</b></p> <p>FROM <input type="text"/> TO <input type="text"/></p>	<p><b>EXAMPLE</b></p> <p>FROM <input type="text" value="1"/> TO <input type="text" value="3"/></p> 
--	---	--

### CASUALTY RECORD

### LOCAL STATISTICS

*Subject to local directions, boxes with a grey background need not be completed if already recorded*

1. Select up to six factors from the grid, relevant to the accident.
2. Factors may be shown in any order, but an indication must be given of whether each factor is **very likely (A)** or **possible (B)**.
3. Only include factors that you consider contributed to the accident. (i.e. do NOT include "Poor road surface" unless relevant).
4. More than one factor may, if appropriate, be related to the same road user.
5. The same factor may be related to more than one road user.
6. The participant should be identified by the relevant vehicle or casualty ref no. (e.g. 001, 002 etc.), preceded by "V" if the factor applies to a vehicle, driver/rider or the road environment (e.g. V002), or "C" if the factor relates to a pedestrian or passenger casualty (e.g. C001).
7. Enter U000 if the factor relates to an uninjured pedestrian.

Road Environment Contributed	101	102	103	104	105	106	107	108	109	
	Poor or defective road surface	Deposit on road (e.g. oil, mud, chippings)	Slippery road (due to weather)	Inadequate or masked signs or road markings	Defective traffic signals	Traffic calming (e.g. speed cushions, road humps, chicanes)	Temporary road layout (e.g. contraflow)	Road layout (e.g. bend, hill, narrow carriageway)	Animal or object in carriageway	
Vehicle Defects	201	202	203	204	205	206				
	Tyres illegal, defective or under-inflated	Defective lights or indicators	Defective brakes	Defective steering or suspension	Defective or missing mirrors	Overloaded or poorly loaded vehicle or trailer				
Injudicious Action	301	302	303	304	305	306	307	308	309	310
	Disobeyed automatic traffic signal	Disobeyed 'Give Way' or 'Stop' sign or markings	Disobeyed double white lines	Disobeyed pedestrian crossing facility	Illegal turn or direction of travel	Exceeding speed limit	Travelling too fast for conditions	Following too close	Vehicle travelling along pavement	Cyclist entering road from pavement
Driver/Rider Error or Reaction	401	402	403	404	405	406	407	408	409	410
	Junction overshoot	Junction restart (moving off at junction)	Poor turn or manoeuvre	Failed to signal or misleading signal	Failed to look properly	Failed to judge other person's path or speed	Passing too close to cyclist, horse rider or pedestrian	Sudden braking	Swerved	Loss of control
Impairment or Distraction	501	502	503	504	505	506	507	508	509	510
	Impaired by alcohol	Impaired by drugs (illicit or medicinal)	Fatigue	Uncorrected, defective eyesight	Illness or disability, mental or physical	Not displaying lights at night or in poor visibility	Cyclist wearing dark clothing at night	Driver using mobile phone	Distraction in vehicle	Distraction outside vehicle
Behaviour or Inexperience	601	602	603	604	605	606	607			
	Aggressive driving	Careless, reckless or in a hurry	Nervous, uncertain or panic	Driving too slow for conditions or slow vehicle (e.g. tractor)	Learner or inexperienced driver/rider	Inexperience of driving on the left	Unfamiliar with model of vehicle			
Vision Affected by	701	702	703	704	705	706	707	708	709	710
	Stationary or parked vehicle(s)	Vegetation	Road layout (e.g. bend, winding road, hill crest)	Buildings, road signs, street furniture	Dazzling headlights	Dazzling sun	Rain, sleet, snow or fog	Spray from other vehicles	Visor or windscreen dirty or scratched	Vehicle blind spot
Pedestrian Only (Casualty or Uninjured)	801	802	803	804	805	806	807	808	809	810
	Crossing road masked by stationary or parked vehicle	Failed to look properly	Failed to judge vehicle's path or speed	Wrong use of pedestrian crossing facility	Dangerous action in carriageway (e.g. playing)	Impaired by alcohol	Impaired by drugs (illicit or medicinal)	Careless, reckless or in a hurry	Pedestrian wearing dark clothing at night	Disability or illness, mental or physical
Special Codes	901	902	903	904						*999
	Stolen vehicle	Vehicle in course of crime	Emergency vehicle on a call	Vehicle door opened or closed negligently						Other – Please specify below

Driver/Rider Only (Includes Pedal Cycles and Horse Riders)

Factor in the accident	<input type="text"/>					
Which participant? (e.g. V001, C001, U000)	<input type="text"/>					
Very likely (A) or Possible (B)	<input type="text"/>					

\* If 999 Other, give brief details .....  
 (Note: Only use if another factor contributed to the accident **and include it in the text description of how the accident occurred**)

*These factors reflect the reporting officer's opinion at the time of reporting and may not be the result of extensive investigation*

## Index to tables and charts

Figures following entries refer to table or chart numbers and **not** to page numbers. A full list of page numbers for the main tables is on page 2. The table, numbers *1a etc*, indicated by *italics* in this index, are included in the review topics. Charts **1a to 5**, shown in **bold** in this index, are to be found in the section **Charts** (see contents pages). Information contained in the text of the review articles is not referred to in the index.

Where necessary, the entries in this list are defined in the section 'Definitions' and relevant information may also appear in the section 'Notes to individual main tables', in the table itself or as a footnote.

### **A Roads:** *1a,3,4,5a-c,14,21,25,26,41a,41b,42,48*
